## Permanent Archiving of Specimens Collected in Nearshore Habitats

### Restoration Project 02608 Final Report

**Study History:** This study was initiated in 2002 to support the acquisition and archiving of marine invertebrate specimens collected as part of EVOS assessment studies in Prince William Sound between 1989 and 1995: (Jewett, S. C., T. A. Dean, R. O. Smith, M. Stekoll, L. J. Haldorson, L. McDonald, and D. R. Laur, 1995). The effects of the *Exxon Valdez* Oil Spill on Shallow Subtidal Communities in Prince William Sound, Alaska, 1989-93. Restoration Project 93047 [Subtidal Study 2A] Final Report to the Alaska Department of Fish and Game; and Jewett, S. C., and T. A. Dean. 1997. The Effects of the *Exxon Valdez* Oil Spill on Eelgrass Communities in Prince William Sound, Alaska 1990-95. Restoration Project Final Report [Restoration Project 95106] Final Report to the Alaska Department of Fish and Game, Habitat and Restoration Division, Anchorage, Alaska. Specimens represent a time series of samples from eelgrass, *Laminaria/A garum*, and silled fjord habitats.

**Abstract:** Specimens of marine invertebrates from 26 sites in Prince William Sound, collected as part of *Exxon Valdez* oil the spill damage assessment, have been accessioned into the University of Alaska Museum. The collections represent five seasons of sampling between 1989 and 1995. At least 499 species are present; of which seven are new records for the region.

**Key Words:** Prince William Sound, *Exxon Valdez* Oil Spill, marine invertebrates, infauna, subtidal, University of Alaska Museum.

#### **Project Data:**

*Description of Data:* Sample sites/year, accession number, habitat, oiled or control, accession numbers, number of species accessioned, number of vials.

For each accession: species list, nomenclature update. Data are in the form of Excel spreadsheets.

*Custodian of Data:* Aquatic Collection, University of Alaska Museum. Contact Nora R. Foster, [fyaqua@uaf.edu](mailto:fyaqua@uaf.edu) or Gordon Jarrell, [fngjh@uaf.edu](mailto:fngjh@uaf.edu).

*Availability:* Specimens are available through a loan request to Aquatic Collection, University of Alaska Museum. Data are also available by request to the University of Alaska Museum Aquatic Collection or the Arctic Archival Observatory, or will be online at [arctos.museum.uaf.edu:8080/AAO](http://arctos.museum.uaf.edu:8080/AAO).

## *Executive Summary*

This project has supported the acquisition and archiving in the University of Alaska Museum of collections made by the University of Alaska School of Fisheries and Ocean Sciences from nearshore subtidal environments of Prince William Sound. As a result, 3297 lots (one taxon from a single site/year) have been accessioned into the University of Alaska Museum. These specimens represent 152 genus-level, 303 species level identifications, and 20 taxa that could not be determined below the phylum or class level. All specimens were of adequate quality to be retained for further study

The nearshore subtidal specimens represent a time series for 26 localities in Prince William Sound. Collections were made in 1989, 1990, 1991, 1993, and 1995. Specimens were collected by divers from three depth ranges down to 20 meters, in eelgrass beds, *Laminaria/Agarum* (kelp) sites, and silled fjords.

Seven species have apparently not been previously recorded in Prince William Sound. The two bivalve mollusks were fairly conspicuous, while the annelids and crustacea were small, and possibly easily overlooked in previous studies. This study adds some qualitative detail to results of earlier studies on the impacts of the *Exxon Valdez* oil spill on subtidal benthic communities in Prince William Sound.

This valuable collection and its associated collecting will be included in a web-accessible database system (the University of Alaska Museum's Arctic Archival Observatory) that assures their perpetual availability to the scientific community.

Species-level determinations, particularly for animals that showed a response to the oil spill will aid in selecting indicator species for future monitoring studies. The physical specimens will be permanently available to assure accurate identifications. The data describing species distribution in the study areas will contribute detail to baseline monitoring.

## ***Introduction***

This project has supported the acquisition and archiving in the University of Alaska Museum (UAM) of collections made by the University of Alaska School of Fisheries and Ocean Sciences from nearshore subtidal environments of Prince William Sound. Collections made by the University of Alaska School of Fisheries and Ocean Sciences represent an extensive survey of the invertebrate fauna of Prince William Sound (Jewett et al. 1995). This valuable collection and its associated collecting data have been included in a system that assures their perpetual availability to the scientific community.

Objectives: The project's objectives are to:

1. Retain specimens and associated locality data collected as part of the *Exxon Valdez* oil spill studies from being lost.
2. Make information based on the specimens (that is, species composition and distribution of Prince William Sound and Gulf of Alaska marine invertebrate fauna ) available to stakeholders.

## ***Methods***

The nearshore subtidal specimens represent a time series for 26 localities in Prince William Sound. Collections were made in 1989, 1990, 1991, 1993, and 1995. Specimens were collected by divers from three depths ranges, to a maximum of 20 meters, within eelgrass beds, *Laminaria/Agarum* (kelps), and silled fjords. For a detailed discussion of field methods, see Jewett et al. (1995) and Jewett and Dean (1997). Identification to genus and species level was accomplished at the University of Alaska School of Fisheries and Ocean Sciences, with additional taxonomic assistance from Nora Foster (mollusks); Leslie Harris, Los Angeles County Museum of Natural History and Jerry Kudenov , University of Alaska Anchorage (annelids); Ken Coyle, University of Alaska and John Chapman, Oregon State University (amphipods and cumaceans).

The specimen archive consisted of 30 “banker’s boxes” containing alcohol-preserved specimens sorted by taxon and locality stored in vials within taped plastic bags. The physical condition of the specimens is excellent, locality and taxonomic information are available with each.

Incorporating the collections into the UA Museum Collection involved three tasks: first, accessioning, in which a permanent record was created for assemblages of specimens to which the museum has title. Second, the specimens were screened for quality, so that fragmentary, damaged or otherwise inappropriate specimens have not been retained. Specimens were also re-identified when appropriate. Finally, specimens have been combined into lots (one species/site/year) labeled, sorted by taxon and stored in sealed jars.

Specimen data (Appendices A-F) have been made available to the Arctic Archival Observatory of the University of Alaska Museum for incorporation in its web- accessible

database. (arctos.museum.uaf.edu:8080/AAO). Data are in the form of Excel spreadsheets, with columns denoting Higher Taxon (phylum: class/order), Family Genus, Species. The column “identified as” is included for species re-identified in this study, or reflects name changes based on taxonomic revisions. A cumulative species list generated from this study was compared to records in Foster and Feder (2000). To determine new species records or unusual occurrences new records, possible mis-identifications (Appendix F).

## ***Results***

University of Alaska Museum Accession numbers 2001-001 to 2001-059 were assigned to specimens acquired through this program (Table 1). The final archive consists of 3297 lots (one taxon from a single site/year). These represent 152 genus-level, 303 species level identifications, and 20 taxa could not be determined below the phylum or class level. All specimens were of adequate quality to be retained for further study (Table 2).

## ***Discussion***

The quality of the specimens was generally very good, reflecting careful storage for 13 years. Of 21,955 specimens screened for quality, 9243 (42%) were retained.

Seven species have apparently not been previously recorded in Prince William Sound. This is not surprising considering the generally poor level of taxonomic and biogeographic data for marine invertebrates in Alaska. Although some taxa were re-identified in the process of screening, several recorded names may reflect inaccurate identifications (Table 12).

The assemblage of species varies from low species richness sites on silled fjords to high diversity eelgrass and *Laminaria/Agarum* sites (Tables 3-11).

The value of the specimens for biodiversity monitoring of Prince William Sound has been demonstrated in an earlier study (Hines et al 2000). The current study contributes qualitative detail to results presented by Jewett and Dean (1997) and Jewett et al. (1995). For example, the infaunal bivalves described as more abundant in control than in oiled sites were re-identified in this study as *Rochefordia tumida* (initially identified as *Mysella*) and two Thyasiridae: the more abundant *Axinopsida serricata*, and the less common *Thyasira flexuosa*. The suspension feeding mytilids, abundant in oiled habitats were redetermined to be *Valisina vernicosa* and *V. seminuda*. Several annelid species, regarded as opportunistic or stress-tolerant were more abundant in oiled than in reference sites: the pectinariid, *Cistenides granulata*, the nereid *Platyneries bicanaliculata*, the spionids (at least 11 species of which *Prionospio cirrifera* and *P. steenstrupi* occurred most often), and at least 5 species from seven genera of Syllidae. Maldanidae, also included in the stress tolerant group most did not preserve adequately for species-level identification. Species-level determinations such as these will aid in selecting indicator species for future monitoring studies.

Several unanswered questions remain. Up to ten species of bryozoa were observed during the sorting process. Identifications, once complete, will add detail to our knowledge of the occurrence of these animals in Prince William Sound, and their response to oil. Identification of the commonly occurring oligochaete annelid, larger ostracods, and copepods should be completed. There is an undescribed archaeannelid annelid *Polygordius* sp. Other questionable taxa noted in the 1995 and 1997 reports should be re-examined by experts. The Isaeidae and Phoxocephalidae were more abundant in reference than in oiled sites (Jewett and Dean 1977) and the Ischyroeridae, Caprellidae Corophiidae, families that showed “patterns suggestive of an initial toxic response to Exxon Valdez oil followed by recovery” still need attention from taxonomic experts on these families.

### *Conclusions*

Although this project cannot by itself support conclusions related to oil spill damage or restoration, the specimens and related data will provide a permanent source of reference specimens and baseline data to add species-level data for future monitoring efforts in Prince William sound and the Gulf of Alaska

### *Acknowledgments*

The authors extend thanks to the sponsors of the project, the Alaska Department of Fish and Game Habitat and Restoration Division, and especially to Bill Hauser, ADFG liaison. We appreciate Steve Jewett's interest in the project and donation of the material to the Museum. We thank the Museum administrative staff for their assistance, and the use of space in the Museum. We thank Gordon Jarrell, UA Museum Mammal Collection for his interest in adding marine invertebrate data to the Arctos database.
