FISCAL YEAR 2007

FINAL WORK PLAN

September 30, 2007

Prepared by:

Exxon Valdez Oil Spill Trustee Council

DENBY LLOYD
Commissioner
Alaska Dept. of Fish and Game

LARRY HARTIG
Commissioner
Alaska Dept. of Environmental Conservation

JOE MEADE
Supervisor
Chugach National Forest
US Department of Agriculture

TALIS COLBERG
Attorney General
Alaska Department of Law

JIM BALSIGER
Director, Alaska Region
National Marine Fisheries Service

HANS NEIDIG
Special Assistant to the Secretary
for Alaskan Affairs
US Department of the Interior

Notice

The abstract of each proposal submitted in response to the FY07 Invitation for Proposals was written by the authors of the proposals to describe their projects. To the extent that the abstracts express opinions about the status of injured resources they do not represent the views of the Executive Director, the Science Director or other staff of the *Exxon Valdez* Oil Spill Trustee Council, nor do they reflect policies or positions of the Trustee Council.

The Alaska Department of Fish and Game (ADF&G) administers all programs and activities free from discrimination based on race, color, national origin, age, sex, religion, marital status, pregnancy, parenthood, or disability. The department administers all programs and activities in compliance with Title VI of the Civil Rights Act of 1964, Section 504 of the Rehabilitation Act of 1973, Title II of the Americans with Disabilities Act of 1990, the Age Discrimination Act of 1975, and Title IX of the Education Amendments of 1972.

If you believe you have been discriminated against in any program, activity, or facility please write:

- ADF&G ADA Coordinator, P.O. Box 115526, Juneau, AK 99811-5526.
- The department's ADA Coordinator can be reached via phone at the following numbers: (VOICE) 907-465-6077, (Statewide Telecommunication Device for the Deaf) 1-800-478-3648, (Juneau TDD) 907-465-3646, or (FAX) 907-465-6078.
- U.S. Fish and Wildlife Service, 4040 N. Fairfax Drive, Suite 300 Webb, Arlington, VA 22203
- Office of Equal Opportunity, U.S. Department of the Interior, Washington DC 20240.

Dear Reader,

Each year, the *Exxon Valdez* Oil Spill Trustee Council funds activities to restore the resources and services injured by the 1989 *Exxon Valdez* oil spill. In 2006, the Council recognized that a tremendous amount of work had been accomplished over 12 years of research, monitoring and specific activities directed at addressing the restoration and rehabilitation goals of the 1994 Restoration Plan (www.evostc.state.ak.us/Policies/restplan.htm). However, the Council determined that results of previous efforts needed synthesis in order to better understand the effects of lingering oil and to evaluate the status of injured resources and services. They decided to realign priorities and restorative activities, placing focus on critical work required to reach closure in areas of restoration related to lingering oil and injured resources.

In this Final Work Plan, the Trustee Council has endorsed a comprehensive, balanced approach to the restoration of injured resources and services which is reflected in this work plan. This approach recognizes the importance of research to determine why resources are not recovering, or are recovering slowly, and recognizes the need for monitoring to track the status of recovery. It provides for cost effective general restoration activities, especially those that help the resources upon which communities and industries depend.

Several resources in the Sound continue to be affected by the spill and have been monitored closely by the Council. While the 1994 Restoration Plan establishes a plan for the restoration of all injured resources and services in the Sound, the current critical status of the Pacific herring requires immediate attention. The Council identified the need for a comprehensive herring restoration program that will help re-establish the declining herring population in Prince William Sound for use by both the commercial fisheries and local subsistence communities.

Herring are an important component of the Sound ecosystem, both ecologically and commercially. Herring were initially impacted by the oil spill, and the Council has continued to classify them as a non-recovering injured resource. Pacific herring are an essential part of the marine food web in the Sound and provide food for birds, marine mammals and invertebrates. Moreover, herring have been fished commercially for food, bait, sac-roe and spawn-on-kelp. The fishery in the Sound collapsed in 1993, four years after the spill, and since then a consistent fishery has not been sustainable. Because herring are a forage fish for many other species, it is speculated that the decline of herring has also had deleterious effects on other animals that depend on them for food. The Council appreciates the dire situation of PWS herring and the ecological and human impact caused by their decline. Therefore, the Council has committed to develop a long-term Herring Recovery Plan and implement enhancement activities with the ultimate goal of assisting herring recovery in the Sound. A restoration planning effort will begin in late 2006. This collaborative planning process will include subsistence-resource users, government agency representatives, non-governmental organizations (NGO), commercial fishermen, scientists and other stakeholders. The Recovery Plan will define critical decision pathways needed to make progress in herring recovery and provide a structure for evaluating and assessing decisions and actions as the recovery effort progresses.

Also, the Trustee Council's commitment to community involvement in the restoration process remains strong. Projects that involve local youth in ongoing restoration and monitoring activities and projects that proposed to enhance subsistence resources injured by the spill were recommended for continued funding. An Environmental Education/Committee Outreach Committee has been formed to develop an inclusive educational outreach plan that will help bring together the EVOSTC scientists and the effected communities in the Oil Spill Region. The Committee consists of EVOSTC Public Advisory Committee (PAC) members, community outreach specialists, teachers, and administrators.

The goal of the committee is to craft an educational outreach program that compliments the science curriculum of schools in the Oil Spill Region and allows students of all ages to participate in ongoing research being conducted by EVOSTC researchers or to engage in their own projects relevant the injured resources and services of the EVOS Restoration program. Allowing students to participate in the research projects will strengthen their sense stewardship, scientific and ecological knowledge of their communities and give them the opportunity to see first hand how their daily decisions make an impact on their environment.

The following final work plan contains proposal information and funding recommendations for proposal received in response to the Trustee Council's FY07 Invitation for Proposals.

Sincerely,

Michael Baffrey
Executive Director

Acknowledgements

I am pleased to acknowledge Trustee Council staff members Carrie Holba, Michael Schlei, Cheri Womac, Barbara Hannah, Catherine Boerner, Mandy Migura, and Shane St. Clair whose hard work and dedication made this Final Work Plan possible. Special thanks to the anonymous scientists who peer reviewed the proposals received this year and thanks also to the principal investigators and their collaborators for giving us so many fine proposals from which to choose in building our program. Many thanks to those scientists from Trustee Council agencies that provided help, and in particular I offer special thanks to Dede Bohn, Carol Fries, Pete Hagen, Hans Neidig, Heather Brandon, Jenifer Kohout, Jennifer Thomson, Larry Dietrick, and Steve Zemke. I also owe thanks for their expert program guidance and peer review efforts to the members of the Science Panel (Steve Braund, Ron O’Dor, Gary Cherr, Tom Dean, Robert Spies, Charles (Pete) Peterson and Leslie Holland-Bartels).

Michael Baffrey, Executive Director

Overview of the FY07 Work Plan

The Final Work Plan comprises multi-year projects submitted in previous years which have received continuous funding by the Trustee Council and new proposals received in response to the FY07 Invitation for Proposals. This document contains the final funding decisions for proposals received for FY07 funding. The Work Plan contains basic information about an individual proposal and its complete record of funding recommendations during the review process.

The Trustee Council received 56 proposals for FY07, of which 31 were funded. Final funding recommendations and decisions for all proposals and descriptions of funded proposals are contained in this document.

Total funding approved for FY07 including continuing projects and new projects was **\$8,759,764**.

The Trustee Council has an open, competitive contracting process that is designed to allow proposals from any source to be considered for funding as an external project. The system works well for this purpose as demonstrated by the fairly even distribution of funding across the home institutions of the principal investigators of external projects.

Continuing Projects in FY07

Project #	Principal Investigator	Project Title (abbr.)	FY07 Funding	First Year Funded
040699	Cokelet	AK Marine Highway System Ferries	\$36,475.00	FY04

Descriptions of New and Continuing Projects in FY07

Project Number: 040699
Project Title: Biophysical Observation Aboard Alaska Marine Highway Systems Ferries
Principal Investigator: Edward Cokelet
Affiliation: NOAA
Disbursing Agency: NOAA
Project Location: Alaska Coastal Current, Prince William Sound
Project Type: Continuing

Funding Approved by Fiscal Year:

FY04: \$171,500.00	FY05: \$185,900.00	FY06: \$145,900.00
FY07: \$36,475.00	FY08: \$0.00	FY09: \$0.00

Total Funding Approved: \$539,775.00

Abstract:

The Alaska Coastal Current flows counterclockwise along the edge of the Gulf of Alaska carrying the river runoff, nutrients and plankton that fuel the productive coastal-marine ecosystem. As seen in satellite images, a strong "chlorophyll front" develops in summer between the nutrient-poor region to seaward and a productive region around Kodiak Island that extends northward to the Kenai Peninsula. Conventional wisdom predicts that the Gulf ecosystem should not be productive because the average wind pattern favors downwelling oceanic conditions that fail to restore nutrients to the sunlit upper layers. The chlorophyll front presents a natural study area over which low and high productivity regions lie in close proximity. The Alaska Marine Highway System ferry M/V Tustumena crosses this front over 280 times each year. We propose to instrument the Tustumena to measure physical and biological oceanographic parameters across the Alaska Coastal Current and in Prince William Sound. This will begin a GEM oceanographic monitoring program in the Gulf that will lead to understanding nutrient replenishment and document ecosystem trends for years to come.

Science Panel Comments:

This is an excellent response to the GEM request for proposals to use State of Alaska ferries as platforms for collecting environmental observations. It requests a major commitment of funds; however the returns are commensurate with the costs. It should generate a working, robust system and a suite of data from tracks of maximum interest in the GEM target region, the oil spill trajectory. The M/V Tustamena is selected because it makes the maximum number of crossings each year of the ACC. The routes (mostly Kodiak-Homer and Kodiak-Seward) will cross the coastal to oceanic chlorophyll front and salinity gradient. It is proposed to follow, by and large, the recommendations of the PICES 2002 report on engine room instrumentation for VOS. A rather full installation is proposed for the ship's April yard period in 2004. A thermosalinograph to sample at the ship's sea chest is to be purchased and installed and backed up by hull conductance thermometry. Cokelet et al. propose to loan the project fluorometry, transmissometry, colored dissolved matter spectrometry (CDOM) and automated nitrate analysis facilities in the first year, replacing them with project-purchased sensors in later years. Cokelet et al. give evidence of experience dealing with ship operators concerning such installations, a key aspect of such projects worldwide. The STAC recommends that the investigators must accommodate the needs of the AMHS regarding in-ship communication. The proposers need to investigate the status of the meteorologic observations collected by the vessel. A wireless remote system is needed to collect these data. Two revisions are required; the real-time communication and costs should be eliminated from the proposal. The ADCP should be eliminated from this proposal because the information received is not proportional to the cost required. Fund contingent upon revised proposal with reduced instrumentation described above.

Science Panel Recommendation: Fund Contingent

Public Advisory Committee Recommendation: Fund Contingent

Executive Director Comments:

Agreement in principle has been reached with the AMHS engineering and operations staff concerned and a memorandum of agreement on the specifics of the project is in process. This agreement and project are historic milestones that provide for highly cost effective monitoring of the coastal environment of Alaska. Revised proposal addressed STAC recommendations.

Executive Director Recommendation: Fund

Trustee Council Comments:

Approved at November 10, 2003 TC meeting.

Trustee Council Decision: Fund

Project Number: 050743
Project Title: Connecting with Coastwalk: Linking Shoreline Mapping with Community-based Monitoring
Principal Investigator: Steve Baird
Affiliation: State Of Alaska
Disbursing Agency: ADFG
Project Location: Kachemak Bay
Project Type: Continuing

Funding Approved by Fiscal Year:

FY05: \$28,900.00	FY06: \$20,300.00	FY07: \$11,900.00
FY08: \$0.00	FY09: \$0.00	FY10: \$0.00

Total Funding Approved: \$61,100.00

Abstract:

The project will evaluate and merge citizen-generated biological and human impact data collected over 20 years of an annual Kachemak Bay CoastWalk shoreline survey with high-resolution mapping of the physical structure of the nearshore environment in Kachemak Bay that nests geographically within ShoreZone mapping. Evaluation of data and data collection protocols and the geographic alignment of CoastWalk zones with ShoreZone units and KBRR's shoreline segments will occur during Year 1. Citizen-based data collection efforts aligned with GEM nearshore monitoring SOPs and methods will be pilot-tested in Kachemak Bay. During Year 2, a Kachemak Bay community/scientist workshop will be held to further integrate and synthesize local information into the Kachemak Bay Research Reserve GIS and to apply the GIS results to the selection of nearshore monitoring sites for community-based monitoring. Piloting will continue, with emphasis on involvement of K-12 teachers and students. During Year 3, nearshore monitoring data collection and data management will be further refined and a website and data entry interface developed. This project will advance the development of a community-based nearshore monitoring program for the GEM program.

Science Panel Comments:

The proposal is recommended for funding. The proposal is responsive to the invitation (shore zone mapping of the nearshore target area, integrate community involvement) and is consistent with GEM strategies (incorporate community involvement and local knowledge) and goals (detect change, provide information to facilitate understanding of causes of change). The project provides a link between nearshore community-based information and long-term monitoring applicable to GEM. The project will build on an existing (19 year) citizen-based, volunteer monitoring program (that is presumably responsive to community concerns) and combine it with a GEM-funded GIS mapping project to assess the utility of this method for future GEM monitoring.

Science Panel Recommendation: Fund

Science Director Comments:

Concur with the STAC recommendation.

Science Director Recommendation: Fund

Public Advisory Committee Comments:

Concur with the STAC and Executive Director recommendations.

Public Advisory Committee Recommendation: Fund

Executive Director Comments:

Concur with STAC recommendation. The project is exemplary of exploring cost effective approaches to collecting baseline data in environments that are vulnerable to oil spills.

Trustee Council Decision: Fund

Project Number: 050749
Project Title: Harbor Seal Monitoring in Southern Kenai Peninsula Fjords
Principal Investigator: Anne Hoover-Miller
Affiliation: Private Enterprise
Disbursing Agency: ADFG
Project Location: Kenai Peninsula
Project Type: Continuing

Funding Approved by Fiscal Year:

FY05: \$97,200.00	FY06: \$130,300.00	FY07: \$82,300.00
FY08: \$0.00	FY09: \$0.00	FY10: \$0.00

Total Funding Approved: \$309,800.00

Abstract:

This proposal supports an existing remote video monitoring system in Aialik Bay, a tidewater glacial fjord. This system is used to observe harbor seals in glacial ice habitats and the impacts of vessels on seals. Haulout activity, numbers of seals, vessel impacts on seals, ambient behaviors of undisturbed seals, glacial activity, ice conditions, weather, and other events affecting seals are recorded daily. Seed funding is requested to test prototype digital still cameras at land-based haulouts in Day Harbor for documenting seals in a fjord lacking tidewater glaciers. Integrations of the remote monitoring into GEM; provides ecological measures of conditions at the heads of fjords that will complement long-term oceanographic monitoring in adjacent waters. This study is augmented by ancillary studies and support from the ASLC and National Park Service through a partnership in the Oceans Alaska Science and Learning Center, the University of Alaska, Fairbanks, Alaska National Maritime Wildlife Refuge System, and Port Graham Corporation.

Science Panel Comments:

The proposal is recommended for funding. The proposal is a good fit with two areas of the Invitation in that it is 1) responsive to Nearshore in developing techniques and SOP for nearshore monitoring in the area of human effects, and 2) it responds directly to needs in lingering oil by linking an injured species to development of the nearshore monitoring program. The proposal also is a good match to the Science Plan, because it addresses an identified gap, measuring the effect of human activities on the nearshore environment. It also proposes to add an important set of physical habitats as yet unaddressed within the Nearshore program, fjords with and without tidewater glaciers. Arguments for the possibility of low cost long-term nearshore monitoring of harbor seal haul out sites and human activities into the GEM program are compelling; however, only testing and experience will provide proof of concept. Technical methods and statistical approaches are straight forward, although the proposed remote still cameras are admittedly experimental. There is very good potential for management application through identifying steps that can be taken to further reduce the impact of vessels on wildlife in the fjords. That the proposal addresses management concerns of the National Park Service and the Port Graham Corporation is evidenced by their collaboration in this work. Community involvement is strong. The proposal speaks to the first two of GEM's five major goals (detect and understand) in that it offers to identify the degree and longevity of perturbations caused by humans on harbor seals within the context of natural variation. It proposes to do so by taking observations on harbor seals and human activities that can be combined with long-standing (i.e. GAK1) and newly developing (i.e. Chiswell mooring, GLOBEC LTOP, NSF (mesoscale) studies and Tustumena ferry box) physical time series in the region. The proposal is strong in that it leverages funds for ongoing monitoring work and personnel and it involves a substantial number of other entities. The personnel are highly qualified local scientists. The STAC expects the data management plan for this project to address digitization of the data, reduction of the data, and long-term archiving of the data.

Project Number: 050742
Project Title: Monitoring of Killer Whales in PWS/Kenai Fjords in 2005-2007
Principal Investigator: Craig Matkin
Affiliation: Private Enterprise
Disbursing Agency: NOAA
Project Location: PWS, Kenai Fjord
Project Type: Continuing

Funding Approved by Fiscal Year:

FY05: \$20,500.00	FY06: \$22,300.00	FY07: \$23,800.00
FY08: \$0.00	FY09: \$0.00	FY10: \$0.00

Total Funding Approved: \$66,600.00

Abstract:

This project continues monitoring of the damaged resident AB pod and other resident pods and the petitioned as depleted AT1 transient population into a cooperative program with additional collaborative support from the Alaska Sea Life Center, NMFS, and various foundations. Monitoring has occurred on a yearly basis since 1984 and was crucial in evaluating the continuing effects from the oil spill. In addition, the role of killer whales in the nearshore ecosystem and possible effects on sea otters will be examined. Community based initiatives such as Youth Area Watch and tour operator educational programs will be integrated. New techniques such as lipid fatty acid analysis for food habit study and radio tagging will be explored and contaminant monitoring will continue. The proposed work will augment current research directed at transient killer whales (ASLC) and provide for annual monitoring of the AB pod and other resident pods. The project will be integrated with oceanographic monitoring as possible.

Science Panel Comments:

This proposal is not recommended for funding. It is premature with respect to the development of GEM monitoring programs in the ACC and the nearshore, since it has not been determined how monitoring of higher vertebrates will be accomplished. Other agencies, and particularly National Marine Fisheries Service, appear to have management responsibility for this species. It therefore appears appropriate to other funding sources such as activities associated with implementation of the Marine Mammal Protection Act. This proposal was not recommended for funding by the STAC last year for the same reasons.

Science Panel Recommendation: Do Not Fund

Science Director Comments:

The GEM Program was structured around four habitat types (Watersheds, Nearshore, Alaska Coastal Current and Offshore) in part in order to avoid conflicts and competitions for funds among geographic localities and among advocates for individual species. Funding work on killer whales is not consistent with the lack of Council funding for abundance surveys on other injured species, such as harbor seals. The EVOSTC has the guiding principles of avoiding duplication of effort and not taking over the responsibilities of other government institutions. As a number of different government entities have mandates and budgets devoted to measuring abundances of charismatic megafauna, as well as economically important species, Council funding for continued work on killer whales is not a priority.

Science Director Recommendation: Do Not Fund

Public Advisory Committee Comments:

Members of the PAC expressed a split view with support for both the STAC and the Executive Director recommendations.

Public Advisory Committee Recommendation: No Consensus

Executive Director Comments:

Although the STAC and Science Director rationales are correct, they fall short by not taking into account the continuing strong public interest in killer whales as a species injured by the Exxon Valdez Oil Spill. In addition, the proposed work is already highly leveraged by funding from the appropriate management agencies and other federal sources, so the STAC recommendation of alternate funding sources already has been accomplished by the project. As also noted last year, the modest cost of this project is a small price to pay for continuing a long-time series on an oil-injured species.

Project Number: 050769
Project Title: Temporal Stability of Fatty Acids used to Discriminate Pacific Herring in Alaska
Principal Investigator: Edward Otis
Affiliation: State Of Alaska
Disbursing Agency: ADFG
Project Location: Gulf of Alaska and Bering Sea
Project Type: Continuing

Funding Approved by Fiscal Year:

FY05: \$67,700.00	FY06: \$89,400.00	FY07: \$25,100.00
FY08: \$0.00	FY09: \$0.00	FY10: \$0.00

Total Funding Approved: \$182,200.00

Abstract:

This project follows up on a promising pilot study that demonstrated the ability to discriminate Alaska herring stocks at relatively fine spatial scales (> 100 km) based on the fatty acid composition of their heart tissue. The investigators propose to assess the temporal stability and biological variability of stock discrimination criteria derived from fatty acid analysis of herring cardiac tissues. Samples will be collected during the spring and fall/winter of 2005 and 2006 from putative herring stocks from Sitka, PWS, Kamishak, Kodiak, Dutch Harbor, Togiak, and Kuskokwim Bay. Results should allow managers to better define ecologically significant stock boundaries, which would likely affect how commercially exploited herring populations are assessed and managed. Results will be published in a peer-reviewed report and may lead to revision of fishery management plans for affected areas. Keywords: Pacific herring, stock identification, fatty acid analysis, Gulf of Alaska

Science Panel Comments:

If this project were successful, the results would be highly advantageous to management of herring stocks in Alaska. The proposal is highly leveraged as it depends heavily on ADF&G platforms and existing data collection programs and thus is quite cost effective. Nonetheless, a positive recommendation can not be given until there is scientific peer validation of the method. Other methods such as molecular genetics may work as well and should be addressed as alternatives in any subsequent proposal.

Science Panel Recommendation: Do Not Fund

Science Director Comments:

Concur with the STAC recommendation.

Science Director Recommendation: Do Not Fund

Public Advisory Committee Comments:

Concur with the STAC recommendation; however herring are important to investigate. Encourage the PI to respond to reviewer comments and resubmit the project as a pilot next year. The Trustee Council should encourage herring proposals since this is still an injured species.

Public Advisory Committee Recommendation: Do Not Fund

Executive Director Comments:

Concur with the STAC recommendation and support PAC recommendation by calling for herring workshop as part of re-examining injured species list in FY 2005.

Executive Director Recommendation: Do Not Fund

Trustee Council Comments:

Trustee Council Decision: Fund

Project Number: 050763
Project Title: Long-term Monitoring of Anthropogenic Hydrocarbons in EVOS Region
Principal Investigator: Jeffrey Short
Affiliation: NOAA
Disbursing Agency: NOAA
Project Location: PWS, Kodiak, Kenai Peninsula
Project Type: Continuing

Funding Approved by Fiscal Year:

FY05: \$58,900.00	FY06: \$58,900.00	FY07: \$58,900.00
FY08: \$0.00	FY09: \$0.00	FY10: \$0.00

Total Funding Approved: \$176,700.00

Abstract:

This proposal seeks support to expand the Long Term Environmental Monitoring (LTEMP) of the Prince William Sound Regional Citizens' Advisory Council (PWSRCAC) in a manner that will make it substantially more powerful in its ability to detect environmental changes induced by petroleum contamination, and possibly other contaminants that have recently been identified as potential insults to the region. This expansion is designed to address the needs of both the PWSRCAC and the GEM programs, in part by combining resources of both organizations. The proposed design incorporates and integrates the existing NOAA and LTEMP monitoring datasets, and proposes a modest enlargement of effort to monitor at a substantially larger spatial scale. Most of the expansion is intended to implement a random-sampling based design that is currently being developed under an FY2004 Trustee Council funded project (Trustee Project 040724: Short - FY04 - Monitoring Exxon Valdez Oil).

Science Panel Comments:

The proposal is recommended for funding. It is a good fit to the Invitation under Lingering Oil and Nearshore development of standard operating procedures (SOP). It also complements and would directly utilize the results of current GEM Lingering Oil study: Short - FY04 - Monitoring Exxon Valdez Oil (040724). The FY 04 study is designed to provide recommendations on how to integrate monitoring for the lingering effects of the Exxon Valdez Oil Spill into GEM Nearshore monitoring programs. The proposal responds directly to the Science Plan (Establish a strategy for monitoring persistence of Exxon Valdez oil, and its relationship to other sources of contamination in PWS) by establishing a background hydrocarbon reference station at Hinchinbrook Entrance and by developing a random sampling approach that would serve as a proxy measure for human development pressure on the nearshore environment. The random sampling approach would simultaneously track the persistence of lingering oil from the EVOS, and serve as a large geographic scale monitoring "station" reflecting human development pressure over a long time scale. The technical merit of the sampling protocols and laboratory analyses is established by adopting the methods of the long-established Long Term Environmental Monitoring Program (LTEMP).

Science Panel Recommendation: Fund

Science Director Comments:

Concur with the STAC recommendation. This proposal makes the lingering oil investigations an integral part of the GEM Nearshore Program.

Project Number: 050765

Project Title: Management Applications: Improving Preseason Forecasts of Kenai River Sockeye Salmon Runs through Smolt Monitoring - Technology Development

Principal Investigator: T. Willette

Affiliation: State Of Alaska

Disbursing Agency: ADFG

Project Location: Cook Inlet

Project Type: Continuing

Funding Approved by Fiscal Year:

FY05: \$68,800.00	FY06: \$65,900.00	FY07: \$67,000.00
FY08: \$0.00	FY09: \$0.00	FY10: \$0.00

Total Funding Approved: \$201,700.00

Abstract:

This project will develop and implement a smolt-monitoring program for Kenai River sockeye salmon as a tool for managing one of the largest and most accessible salmon stocks in Upper Cook Inlet. Sockeye salmon smolt population estimates will be used to develop preseason forecasts of run size for this stock. The Alaska Board of Fisheries has specified that the Kenai River sockeye salmon run will be managed based upon preseason and inseason forecasts of run strength, and inriver escapement goals for this system vary as a function of these forecasts. This management structure causes relative uses of the resource by recreational, personal use, and commercial fishers to be strongly dependent on the accuracy of forecasts. The project will use two independent methods to estimate the population size of sockeye salmon smolt emigrating from the Kenai River watershed. GEM funding is requested to support estimation of smolt population size using mark-recapture methods. ADF&G funding will support estimation of smolt population size using side-looking sonar. During the first two years of the project, we will evaluate the accuracy and precision of our estimates and identify the methodology that provides the best estimate at the lowest cost. In the third year, we will implement this new method to estimate smolt population size. The project will also estimate the proportion of marine-derived elements in smolts, beginning a database needed to evaluate the effect of marine nutrient contributions on salmon production in this and other systems.

Science Panel Comments:

The proposal is recommended for funding. The proposal responds to the management application section of the invitation call to “utilize or augment existing biological monitoring programs to develop a new application or enhance an existing application to management, while building the basic data to implement the GEM ecosystem model.” It is responsive to the science plan call to, “identify and demonstrate statistically rigorous sampling strategies for detecting marine signals and proxies from plants and animals in the marine watersheds ...” Technical merit of this proposal is very high, as it adequately copes with the formidable difficulties of estimating smolt abundance in the Kenai River; as the proposal notes, estimation of smolt abundance in the Kenai has failed in the past. The proposal demonstrates a thorough understanding of the challenges, and it proposes an adaptive and innovative strategy for meeting the challenges, using a variety of sampling techniques at a number of different locales in the watershed. Potential management applications are substantial and include 1) predictors of future adult salmon returns allowing more responsive management to assure sustainable escapements while optimizing harvest opportunities, 2) using juvenile production as an indicator of freshwater ecosystem health, 3) identification and control of factors that influence salmon population trends, 4) use of marine survival information to further explain causes and variability in salmon population trends, and 5) recovery of tagged adult Chinook and coho salmon during their ocean migration to provide location and interception information to aid in interpretation of the effect of ocean and climate on marine survival of salmon and related species. Community involvement strategies are apparent but not well explained. The proposal is responsive to all five of GEM’s major goals, providing data and analysis relevant to detecting and understanding change in

watersheds, informing managers and other interested parties about impending changes in natural resources, solving resource management problems with appropriate information, and predicting future states of natural resources. The proposal is also particularly responsive to two of the six “implementation” goals of GEM, because it leverages application of EVOSTC funds to augment ongoing monitoring work funded by ADF&G, and it would facilitate application of GEM research and monitoring results to benefit conservation and management of marine resources, as explained under management applications above. The budget is highly leveraged by funds from ADF&G sources and it is reasonable for the proposed objectives. The PIs are exceptionally well qualified to do this type of work, and their salaries are not charged for in the budget, which includes only extra seasonal personnel costs. The proposal was exceptionally well written and the methods and limitations of the sampling gears were carefully explained.

Science Panel Recommendation: Fund

Science Director Comments:

Concur with the STAC recommendation. This proposal is a strong response to the management applications section of the invitation.

Science Director Recommendation: Fund

Public Advisory Committee Comments:

Concur with the STAC and the Science Director recommendations; however the proposal needs to make better connections with the communities it serves. In particular the ADF&G Regional Planning Team and the regional aquaculture associations have relevant information to share and interests in the outcome of the work and they should be consulted.

Trustee Council Decision: Fund

Project Number: 070808
Project Title: Sea Otter Recovery and Nearshore Synthesis
Principal Investigator: Brenda Ballachey
Affiliation: DOI
Disbursing Agency: USGS
Project Location: Prince William Sound
Project Type: New

Funding Approved by Fiscal Year:

FY07: \$154,000.00	FY08: \$97,700.00	FY09: \$0.00
FY10: \$0.00	FY11: \$0.00	FY12: \$0.00

Total Funding Approved: \$251,700.00

Abstract:

Sea otters, and other nearshore birds and mammals were severely impacted by the 1989 Exxon Valdez oil spill. In areas where acute effects were greatest and lingering oil persists longest, recovery for some of those nearshore birds and mammals remains incomplete through 2005. We present three objectives in this proposal: (1) Evaluate progress toward sea otter recovery through surveys of abundance and carcass deposition. (2) Evaluate factors contributing to the status of sea otter populations through the synthesis of long-term data sets on individual exposure to oil, health, condition, behavior, and home range in the context of long-term survival. (3) Conduct spatial synthesis of elevated biomarkers in mammals, birds, and fishes. Anticipated outcomes will identify shorelines where lingering oil most likely persists and which may be candidates for restoration or remediation.

Science Panel Comments:

The proposed project will extend long-term data sets on the population abundance and survival that are critical to the continued evaluation of injury and recovery of sea otters. In addition, the project will provide important syntheses of past data on population dynamics of sea otters and exposure of sea otters and other injured nearshore resources to oil. These syntheses will allow further assessment of the relative importance of continued oil exposure to sea otter recovery, provide information that will help in evaluation of the efficacy of potential restoration activities, and help to guide decisions regarding locations where clean up of oiled shorelines might be considered. The panel recognizes the excellent publication record of the Principal Investigators, but urges them to publish results of biomarker work that has yet to be fully addressed in peer reviewed publications.

Science Panel Recommendation: Fund

Science Director Comments:

Objectives in the Study: 1) Evaluate sea otter population dynamics through carcass recovery and surveys 2) Integrate existing data to evaluate constraints to otter recovery 3) Identify areas where otters are exposed to oil and overlap with other injured resources still being exposed to oil. This proposal is directly responsive to the 07 Invitation. The modeling component will address the question regarding the temporal need for sea otter recovery. It will address how the spatial overlap of animals with elevated CYPIA are related. It's cost effective.

Concur with Science Panel. It is necessary to continue the carcass surveys in order to determine age-specific mortality which can be used in a population model. To be useful this information needs to be collected every year. The spatial synthesis of elevated biomarkers in a suite of nearshore species may allow them to identify 'hot spots' of oil exposure which could be beneficial in prioritizing areas of lingering oil.

Project Number: 070624
Project Title: Acquisition of Continuous Plankton Recorder Data
Principal Investigator: Sonia Batten
Affiliation: NGO
Disbursing Agency: NOAA
Project Location: Cook Inlet, Alaskan Shelf, Gulf of Alaska
Project Type: New

Funding Approved by Fiscal Year:

FY07: \$135,400.00	FY08: \$0.00	FY09: \$0.00
FY10: \$0.00	FY11: \$0.00	FY12: \$0.00

Total Funding Approved: \$135,400.00

Abstract:

This project will use a Continuous Plankton Recorder to collect plankton samples from the Alaskan shelf and Gulf of Alaska to determine variability in abundance and distribution of herring prey. Understanding variability in their food source is one requirement for understanding variability in Prince William Sound herring populations. Recent CPR data have shown large differences in mesozooplankton biomass on the Alaskan shelf in 2004 and 2005. This project will increase the time series of data collected with previous EVOS TC funding and improve our understanding of how the food chain supporting Alaskan fisheries is regulated.

Science Panel Comments:

This project has been funded for several years by the Trustee Council and funds are being requested for an additional year. This project provides the only long term record of plankton abundance and species composition important to understanding the inter-annual variation in herring food from the Gulf of Alaska. This information is necessary to understand herring mortality and long term trends in herring abundance. This project is cost effective because the PI is utilizing ships of opportunity transecting the entire Gulf of Alaska thus funding for a vessel is not required.

Science Panel Recommendation: Fund

Science Director Comments:

This project collects important long-term plankton trend data across the Gulf of Alaska and is very cost effective because the instruments are located on ships of opportunity and vessel costs are not needed. However, the vessel routes have recently changed and the ships no longer move through Prince William Sound: they go into Cook Inlet. Although the link between these data and Prince William Sound herring likely exist, the tie is not clear in the proposal. This project is scientifically solid, and the data are important, but the connection to Trustee Council concerns is not strong.

Funding Approved by Fiscal Year:

FY07: \$122,700.00	FY08: \$134,600.00	FY09: \$77,700.00
FY10: \$0.00	FY11: \$0.00	FY12: \$0.00

Total Funding Approved: \$335,000.00

Abstract:

More information is required to understand the life history of Pacific herring and thus success of future enhancement experiments designed to improve the survival rate of juveniles into adulthood. Chemical analysis of trace element concentrations in otoliths can be used to identify geographic signatures of natal habitats used by fishes captured either as juveniles or adults. Because survival of the population is dependent on successful spawning, it is imperative to understand if distinct groups of herring are contributing to the success of the population. If most of spawning success comes from a distinct groups of herring we need to know which population survived and why. This will allow us to protect the most important populations and also identify those environmental variables needed to enhance other populations. With the information gained from this project, we will be able to identify other habitats that may be suitable for herring recolonization projects.

Science Panel Comments:

Not Available

Science Panel Recommendation: Fund

Science Director Comments:

This project will result in the identification of bays used as natal habitat by individual herring. Upon determining where fish are raised, specific characteristics of these bays can be measured. This will then help decide where enhancement activities such as larval or egg transport would best succeed. Reduce funding by the amount needed for meeting travel other than the annual EVOS meeting.

Project Number: 070814
Project Title: Seabird Predation on Juvenile Herring in Prince William Sound
Principal Investigator: Mary Anne Bishop
Affiliation: DOI
Disbursing Agency: USGS
Project Location: PWS & NE PWS (Sheep Bay, Simpson Bay, Port Gravina)
Project Type: New

Funding Approved by Fiscal Year:

FY07: \$197,000.00	FY08: \$0.00	FY09: \$0.00
FY10: \$0.00	FY11: \$0.00	FY12: \$0.00

Total Funding Approved: \$197,000.00

Abstract:

Based on population trends, the Prince William Sound (PWS) Pacific herring population does not show signs of recovering. Predation pressure on juvenile herring may be an important factor in preventing recovery. Here we propose a large-scale, three-year study to investigate seabird predation on juvenile herring during winter months (October-March), a season about which relatively little is known. Juvenile herring are heavily predated by multiple species of seabirds including five species injured by the Exxon Valdez Oil Spill, one recovering species, and one recovered species. We will examine the spatial and temporal abundance of seabird predators in and around juvenile herring schools, as well as the physical and biological characteristics of the schools they feed on. Our project relies on seabird surveys being performed onboard vessels associated with three other projects (2 proposed EVOS studies, 1 PWSSC study) conducting hydroacoustic surveys for juvenile herring schools. Our estimates of juvenile herring consumption will aid in planning future restoration efforts as well as in assessing the role of seabird predation on herring recruitment by providing data to both herring and ecosystem modeling efforts.

Science Panel Comments:

This proposal fills an important gap in our knowledge of herring predators and their impacts on herring populations. Therefore, the proposal is being recommended for funding with revisions. The authors need to specifically identify how the project will provide an estimate of the number and sizes of herring being eaten by birds in the winter. Also, it is unclear how this data is to be used in a comprehensive life history model of herring and how they will extrapolate their information to all of PWS. The panel suggests the PI's consider aerial surveys to provide a Sound-wide estimate of abundance and distribution of seabirds feeding on herring.

Science Panel Recommendation: Fund

Science Director Comments:

The Science Director is on a detail from the FWS and must recuse herself from making recommendations on proposals that involve FWS personnel. The co-PI on this project is an employee of the FWS.

Project Number: 070750
Project Title: Database Development and Implementation of Long-Term Monitoring for Evaluation of Recovery of Nearshore Resources
Principal Investigator: James Bodkin
Affiliation: DOI
Disbursing Agency: USGS
Project Location: Prince William Sound
Project Type: New

Funding Approved by Fiscal Year:

FY07: \$135,300.00	FY08: \$0.00	FY09: \$0.00
FY10: \$0.00	FY11: \$0.00	FY12: \$0.00

Total Funding Approved: \$135,300.00

Abstract:

The proposed project is designed to assist in the evaluation of recovery and restoration of injured nearshore resources in Prince William Sound. The project has two tasks. The first is to develop a database management system for nearshore data. The database management system will be developed using a web-based user interface and an underlying relational geodatabase. This database management system will ensure the preservation of existing nearshore monitoring data, allow for more integrated assessments of recovery and restoration of nearshore resources, and provide a structure for data gathered as part of future restoration monitoring. The second task is to initiate long-term recovery and restoration monitoring in the nearshore in Prince William Sound. Many of the data sets used to assess recovery of injured resources in Prince William Sound (e.g. population abundance and survival of sea otters, population abundance of harlequin ducks and other nearshore birds, abundance estimates for mussels, clams, and other intertidal organisms) are also a critical part of a comprehensive nearshore monitoring plan developed by Dean and Bodkin (2006) that is currently being implemented by the National Park Service along the Katmai coast. Funds for conducting most of these studies in Prince William Sound (e.g. aerial surveys of sea otter abundance, bird and mammal surveys, and shore-zone mapping) are being sought by several other proposals submitted to the Trustee Council and are not addressed herein. Our purpose is to fill in missing gaps in the long-term monitoring program in Prince William Sound and to make it comparable to the program being carried out at Katmai. This proposed nearshore sampling in PWS, the similar sampling being conducted on the Katmai coast, and the proposed development of a comprehensive nearshore database management system will provide the backbone of a long-term restoration monitoring program. The goal of this program is to detect and identify sources of change in the nearshore and to foster recovery of nearshore resources by ameliorating adverse effects of human-induced impacts.

Science Panel Comments:

This proposal provides a logical next step in development of a program to determine long-term health of the intertidal community and associated resources that were clearly impacted by the spill. It specifically addresses recovery status of injured intertidal communities for which little current information is available. The proposal builds on work funded by other agencies to provide an important gulf-wide perspective. Also, proposed database development will facilitate future integration and syntheses regarding nearshore resources including intertidal communities, sea otters, oyster catchers, and other nearshore birds.

Science Panel Recommendation: Fund

Science Director Comments:

Concur with Science Panel. This project takes a phased approach to developing a systematic way of assessing the

nearshore environment in which the Trustees have previously invested. Collectively, the overall status of the intertidal environment has not been consistently evaluated. This project will build upon earlier work that developed the methods for assessing the nearshore and more fully implement the program on the ground. It is being done in conjunction with the National Park Service which is a partner in this program. Finally, it will provide a relational database for storing this information, which will allow for a wide range of uses of the data.

Data Manager Comments: Fund The PIs propose to develop a nearshore monitoring system, and to bring on a database developer to assist the National Park Service and the EVOS staff in development of this system. They also propose to initiate long-term recovery and restoration monitoring in the nearshore environment of Prince William Sound.

The nearshore monitoring aspects of this proposal are responsive to the invitation and it appears to address the status of many of the species injured by the spill. The Trustee Council has expressed its desire to see the nearshore data management system developed. Though some initial work on this system has been completed, as documented in the proposal, substantial progress has been delayed due to a lack of resources and staff turnover in the EVOS office. This project will provide the resources necessary to ensure the project's completion and address the need for data management personnel to work closely with the PIs to complete the implementation of standard operating procedures (SOPs). The budget seems reasonable for the work to be done.

Project Number: 070836
Project Title: Factors Responsible for Limiting the Degradation Rate of Exxon Valdez Oil in Prince William Sound Beaches-Submitted under the BAA
Principal Investigator: Michel Boufadel
Affiliation: Non AK University
Disbursing Agency: NOAA
Project Location: Prince William Sound
Project Type: New

Funding Approved by Fiscal Year:

FY07: \$434,800.00	FY08: \$552,500.00	FY09: \$266,600.00
FY10: \$0.00	FY11: \$0.00	FY12: \$0.00

Total Funding Approved: \$1,253,900.00

Abstract:

This proposal will provide important data for explaining the cause of the lingering oil in many of the Prince William Sound beaches affected by the 1989 Exxon Valdez oil spill. Because biodegradation of oil occurs at the oil-water interface, limitations occurring in the vicinity of that interface are hypothesized to be the primary reason for the lingering oil. In this study, we propose to investigate the two major sources of limitation: (1) environmental limitations, which involve nutrient concentrations (nitrogen, phosphorus, and dissolved oxygen) and their transport to the oil-water interface, and (2) the existence of an impenetrable layer or "skin" on the oiled sediment, which inhibits the bioavailability of oil. This often occurs when oil is stranded in the subsurface. The latter will be assessed by use of Scanning Electron Microscopic (SEM) examinations of oiled sediment. The effects of hydrodynamics will be assessed using tracer studies and 2-D or 3-D physics-based modeling of solute (i.e., nutrient) transport through the beach matrix. Hydrodynamics studies are important to understand the delivery (i.e., transport) of limiting nutrients to the oil-water interface. Extensive measurement of nutrient concentrations on PWS beaches will also be conducted to ascertain the extent of nutrient limitations on the biodegradation process. To our knowledge, this is the first rigorous study that addresses how the hydrodynamics of PWS beaches relate to the potential of bioremediation in relieving the aforementioned limitations. The proposed research will provide important inputs to an overall understanding of the transport and fate of oil in the PWS beaches and will provide guidance on how to accelerate the disappearance of the lingering oil present in the subsurface.

Science Panel Comments:

This proposal will examine and attempt to explain the cause of the lingering oil on PWS beaches. The proposal is well written and would give us information that is needed to determine why EVOS oil continues to linger in PWS. However, there is concern that the proposers have no experience working in the PWS environment and may need to adjust their methods as the project proceeds. We recommend that they proposal be funded for FY07 only at this time and reviewed in FY08 to determine the need for continuing funding.

Science Panel Recommendation: Fund Reduced

Science Director Comments:

This project is technically sound and will provide answers related to the feasibility of implementing bioremediation activities in areas with lingering oil. The Science Panel and the Science Director raised several questions about the original proposal and asked the PIs to address them and provide revisions. Issues raised by the Science Panel included, 1) Small sample size (only two beaches) and related concerns with geographic scale of inference and statistical power; 2) Lack of temporal replication (summer only sampling) and possible differences in measured

variables among seasons; and 3) Evaluation of previous EVOS studies which may have provided similar information. The PIs were very responsive to the requests and produced a tighter, more focused proposal which will provide the information needed to determine if environmental conditions in areas with lingering oil will support a cost-effective bioremediation project. The Science Panel requested that the PIs provide a more robust study design and increase the number of sampling sites across several seasons. The changes that the PIs suggested, not surprisingly, increased the cost of the study.

The Science Panel recommended that one year of the study be funded, and future funding be reviewed in FY08. While I agree that the results of the FY07 field season should be evaluated and the study modified to incorporate results as they are learned, I don't agree with the Science Panel that only one year of funding should be provided. In order for the PIs to have a complete picture of the environmental conditions present in PWS, and data collected from enough sites to have a broad geographical scale of inference, the study should be funded in its entirety. If the Trustee Council is interested in pursuing bioremediation of areas with lingering oil as part of the restoration program, this project will provide information that will be necessary in determining whether bioremediation on a large-scale in PWS is feasible.

Science Director Recommendation: Fund

Public Advisory Committee Comments:

Not Applicable

Public Advisory Committee Recommendation: Not Reviewed

Executive Director Comments:

This proposal will provide an explanation of the cause of lingering oil and the feasibility of implementing bioremediation activities in areas with lingering oil. Because biodegradation of oil occurs at the oil-water interface, limitations occurring in the vicinity of that interface are hypothesized to be the primary reason for the lingering oil. However, I recommend only funding a one-year study with a much reduced scope that specifically addresses these limitations and whether bioremediation is a feasible alternative for removing lingering oil. If feasible, the Trustee Council can invite the PIs to submit a future proposal that builds on the findings of this proposal which integrates direct restoration.

Project Number: 070816
Project Title: Evaluating Harlequin Duck Population Recovery: CYP1A Monitoring and a Demographic Population Model
Principal Investigator: Daniel Esler
Affiliation: Non AK University
Disbursing Agency: USGS
Project Location: Prince William Sound
Project Type: New

Funding Approved by Fiscal Year:

FY07: \$177,800.00	FY08: \$23,900.00	FY09: \$0.00
FY10: \$0.00	FY11: \$0.00	FY12: \$0.00

Total Funding Approved: \$201,700.00

Abstract:

Harlequin ducks are one of the few species defined as “not recovered” from the 1989 Exxon Valdez oil spill. In this document, we propose 2 areas of inquiry to (1) evaluate the status of population recovery, specifically the degree of exposure to lingering oil, and (2) more fully understand the demographic processes underlying population recovery, through application of a quantitative population model.

Cytochrome P4501A (CYP1A) has proven to be an extremely useful tool for documenting the spatial and temporal degree of exposure to lingering oil, and there is a large body of historical CYP1A data (1998 to 2005) for harlequin ducks. The most recent data from March 2005 irrefutably demonstrated that harlequin ducks continued to be exposed to lingering oil. Because population recovery requires cessation of exposure to oil, we propose to resample harlequin ducks from throughout the oiled area of Prince William Sound, along with nearby unoiled areas, to determine whether they continue to be exposed to lingering oil.

A considerable volume of demographic data on harlequin ducks has been collected during research and monitoring efforts since the spill. We propose to assemble these data in a population model, which will be valuable for: (1) identifying the timing and magnitude of oil spill injury, (2) identifying the mechanisms by which injury occurred and population recovery was constrained, (3) evaluating the current status of recovery, including predictions for timing of full recovery, and (4) recommending future restoration activities.

Science Panel Comments:

The proposed project will extend long-term data sets on potential exposure of Harlequin ducks to oil that is critical to the continued evaluation of injury and recovery of harlequin ducks. In addition, the project will provide important syntheses of past data on population dynamics of harlequin ducks. These syntheses will allow further assessment of the relative importance of continued oil exposure to harlequin recovery and provide information that will help in evaluation of the efficacy of potential restoration activities.

Science Panel Recommendation: Fund

Science Director Comments:

This proposal will tie together years of harlequin duck data from the spill area that prior to now has not been synthesized in such a way that leads to a comprehensive understanding of harlequin population dynamics that have occurred as a result of the spill. This project will provide a predictive tool for understanding initial population impacts of the spill and possible population recovery scenarios.

Disbursing Agency: ADFG
Project Location: Trustee Council Office
Project Type: New

Funding Approved by Fiscal Year:

FY07: \$2,229,153.00	FY08: \$0.00	FY09: \$0.00
FY10: \$0.00	FY11: \$0.00	FY12: \$0.00

Total Funding Approved: \$2,229,153.00

Abstract:

The Council adopted a new budget structure in FY 2006 in order to more clearly identify the allocation of funds supporting Trustee Council activities. The presentation of the initial Annual Program Development and Implementation Budget instituted in FY 2006 is being mirrored within the submittal of this funding request for FY 2007. The intent is to continue emphasizing the estimated costs associated with the current activities and directives of the Trustee Council.

This budget has been developed with the focus on completing the Trustee Council's planned activities detailed within the "Interim Guidance Document" implemented in August of 2005 and effective through December 2006, as well as initiating any restoration planning efforts resulting from the determinations regarding the fate and impact of lingering oil in the spill area and the status of injured resources and services identified in the updated list.

In addition, this budget expands upon activities started in FY 2006 toward developing a plan for herring recovery; and includes estimates of the direct and indirect costs of the Trustee Council's agencies and administrative office, in providing services for the Trustee Council's programs and approved projects of FY 07.

The "Program Development and Implementation Budget" includes the following components:

- Administration Management
- Data Management
- Science Management
- Community Involvement
- Public Advisory Committee (PAC)
- Small Parcel Program
- Trustee Council Member Direct Expenses
- Program Support/Project Management by Agencies
- Alaska Resource Library & Information Services

Various aspects of the italicized components are undertaken by Trustee Council agencies providing program development and administrative support.

Although funding for liaisons, project managers, and other support staff is included in the Program Support and Project Management component, the final budget for this component cannot be accurately determined until the Trustee Council takes action on the FY 07 Work Plan. This component is an initial funding request. Upon adoption of the FY 07 Work Plan, additional project management funds for each agency will be requested in proportion to the number and complexity of funded projects assigned to each agency for management. At that time the budget will be revised to reflect this additional expense.

The Trustee Council Office is administratively located within the Alaska Department of Fish and Game. Allocation of funds by agency is detailed within the Budget Summary.

Funding Approved by Fiscal Year:

FY07: \$163,636.00	FY08: \$0.00	FY09: \$0.00
FY10: \$0.00	FY11: \$0.00	FY12: \$0.00

Total Funding Approved: \$163,636.00

Abstract:

NOAA Award No. NA03NOS4730188 – Modification of Scope for FY 07 – Approved 9/25/06

The efforts of the scientific activities in FY 06 resulted in a key focus of planning efforts towards “Herring Restoration.” This abstract details the modified scope explanation as submitted to NOAA by the Exxon Valdez Oil Spill Science Director. These herring recovery efforts are being funded with lapsed funds from this award in the amount of approximately \$163,636.

Participants of the FY 06 Herring Workshop formulated a synopsis of herring ecosystem information; identification of data gaps and limitations of current information; and the discussion of how to proceed with additional monitoring of herring, as well as how to effectively develop a plan for their recovery. The participants agreed (via consensus) that a long-term restoration/recovery plan should be developed and implemented for Pacific Herring in Prince William Sound. The planning processes include stakeholders, community members and scientists. The restoration plan will be developed to define critical decision pathways needed to make progress in herring restoration, set criteria for recovery and provide an avenue for evaluation during the implementation of the plan. The Trustee Council approved for a 6 – 8 member team to initiate these planning efforts; obtain non-agency personnel to write, edit and review drafts of a formal plan; and publish and distribute the plan upon completion. In addition the Trustee Council approved funding to obtain guidance from international experts with herring recovery successes in other countries, i.e., the procurement of a “white paper” on herring recovery efforts and the planning of an International Herring Symposium.

The initial phase is the formulation of the Herring Recovery Plan. A recovery team will be established to write, plan and direct the herring restoration and recovery actions. The plan is to include the background describing the problem and threats (habitat, exploitation, inadequate regulatory protection mechanisms, disease/predation, and other factors); formulate measurable objectives for determining herring recovery status; provide the descriptions of herring recovery tasks (projects) worthy of pursuit; and, provide full details within an implementation table. In addition, a conceptual model will be formulated for evaluating the on-going progresses, changes, and necessary corrective actions.

Project Number: 070817
Project Title: Physical Oceanographic Factors Affecting Productivity in Juvenile Pacific Herring Nursery Habitats, submitted under the BAA
Principal Investigator: Shelton Gay
Affiliation: NGO
Disbursing Agency: NOAA
Project Location: Prince William Sound
Project Type: New

Funding Approved by Fiscal Year:

FY07: \$71,400.00	FY08: \$0.00	FY09: \$0.00
FY10: \$0.00	FY11: \$0.00	FY12: \$0.00

Total Funding Approved: \$71,400.00

Abstract:

Past research of juvenile Pacific herring in PWS has shown that recruitment is highly influenced by conditions within nursery sites affecting survival within the first year. Studies of the physical oceanography of nursery fjords has indicated that each site has a unique set of hydrographic conditions that are influenced by both local processes and water exchange between the GOA and PWS. These factors vary significantly depending on geographic location. The proposed study will build upon past research by continuing a hydrographic time series within nursery fjords and collect high resolution data on currents and hydrography to determine the dominant mechanisms of water exchange and circulation within two experimental fjords; one located in a highly productive sub-region (Simpson Bay) and one located in less productive sub-region influenced by tidewater glacial outflow (Whale Bay). Also, this project will provide a physical context for a suite of biological sampling proposed for these sites.

Science Panel Comments:

This proposal is responsive to the Invitation and the PI is qualified to complete the work. This project is an expansion of a four bay study initiated under the Sound Ecosystem Assessment (SEA) program to examine hydrographic and circulation patterns in PWS. It will share a platform and information with projects collecting plankton data (Kline) and distribution and abundance measurements of herring (Thorne). Gay should work closely with Crawford to combine similar data collections on multiple geographic scales. The Panel also recommends that at least two addition CDT units be deployed in PWS and additional funding be provided to the PI for these units.

Science Panel Recommendation: Fund

Science Director Comments:

Concur with the Science Panel, and strongly recommend the additional CDT's are funded and deployed.

Project Number: 070819
Project Title: Prince William Sound Herring Disease Program
Principal Investigator: Paul Hershberger
Affiliation: DOI
Disbursing Agency: USGS
Project Location: Prince William Sound
Project Type: New

Funding Approved by Fiscal Year:

FY07: \$246,500.00	FY08: \$257,100.00	FY09: \$258,600.00
FY10: \$272,800.00	FY11: \$0.00	FY12: \$0.00

Total Funding Approved: \$1,035,000.00

Abstract:

A leading hypothesis accounting for the decline and failed recovery of the herring population in Prince William Sound involves epizootic mortality resulting from infectious and parasitic diseases. Ongoing and past surveillance of herring diseases in PWS, initiated by Dr. Gary Marty and continued by ADF&G through the herring disease index, is extremely valuable and necessary to document changes in disease prevalence, but field surveys are unable to unequivocally demonstrate epidemiological relationships that modulate disease cycles. This proposed multi-year Herring Disease Program (HDP) consists of three components intended to provide predictive metrics that forecast future disease epidemics and offer empirical relationships useful in developing adaptive management policies to mitigate the effects of epizootic and chronic diseases. The first component involves laboratory validation of the ongoing PWS herring disease index. Long-term continuation of the herring disease index, paired with laboratory validation, is necessary to confirm the efficacy of future adaptive disease management strategies. The second component involves empirical studies intended to determine the basic epidemiological relationships between environmental and biological factors influencing infection / disease prevalence. The final component involves development of immunological and molecular tools that will be useful in predicting the potential for future disease epidemics. Combined, this three-tiered approach will provide the basic epidemiological information necessary to develop and validate adaptive management techniques intended to mitigate the effects of future herring disease outbreaks in PWS.

Science Panel Comments:

Disease is an important consideration in the development of a comprehensive herring restoration program, and this is the only project that proposes to take an in-depth look at disease factors. The PIs are experts in the field and qualified to conduct the work. The panel recommends removing the immune gene expression objective, which is not well conceived or detailed in the proposal. Also, the PI should expedite the development of lab methods, so they can be used as tools to assess disease status in the field while captive work continues. A field component should also be added in Year 2 with concentration on Sitka (healthy stock) population for field validation.

Science Panel Recommendation: Fund

Science Director Comments:

Concur with the Science Panel. No other disease proposals were submitted to the Trustees, and disease plays an important role in the current state of PWS herring. However, disease is not fully understood in the PWS herring population. Understanding disease is vital to any direct intervention activity, so that the spread and expansion of disease problems can be prevented.

Project Number: 070751
Project Title: Prince William Sound Marine Bird Surveys, Synthesis and Restoration
Principal Investigator: David Irons
Affiliation: DOI
Disbursing Agency: USGS
Project Location: Prince William Sound, Alaska
Project Type: New

Funding Approved by Fiscal Year:

FY07: \$191,200.00	FY08: \$0.00	FY09: \$0.00
FY10: \$0.00	FY11: \$0.00	FY12: \$0.00

Total Funding Approved: \$191,200.00

Abstract:

We propose to conduct small boat surveys to monitor abundance of marine birds in Prince William Sound, Alaska during March and July 2007-2011. Eight previous surveys have monitored population trends for >65 bird and 8 marine mammal species in Prince William Sound after the Exxon Valdez oil spill. We will use data collected in 2007-2011 to examine trends from summer and from winter to determine whether populations in the oiled zone are increasing, decreasing, or stable. We will also examine overall population trends for the Sound. To help determine when recovery has occurred we will examine population trends in other areas outside of Prince William Sound, and conduct population modeling for the non-recovered species. Continued monitoring of marine birds and synthesis of the data are needed to determine whether populations injured by the spill are recovering. Data collected from 1989 to 2005 in the oiled area indicated that bald eagles (*Haliaeetus leucocephalus*), common loons (*Gavia immer*), and cormorants (*Phalacrocorax* spp) are increasing in winter. Numbers of all other injured species are either not changing or are declining in the oiled area. Populations of harlequin ducks (*Histrionicus histrionicus*), black oystercatchers (*Haematopus bachmani*) and common murrelets (*Uria aalga*) are showing no trend in the oiled area; pigeon guillemots (*Cephus columba*), marbled murrelets (*Brachyramphus marmoratus*), and Kittlitz's murrelets (*Brachyramphus brevirostris*) are declining in the oiled areas of Prince William Sound. Results of all surveys have been summarized in reports and results through 1998 have been published by Irons et al. (2000) and Lance et al. (2001). Analyses and synthesis of these survey data are the only ongoing means to evaluate the recovery of most of these injured species. A final report will be written upon completion of the project that will address population status of injured species, additionally, results will be published in a peer reviewed journal.

Science Panel Comments:

The proposal provides for the extension of an important long-term data set that is critical to the evaluation of recovery of injured bird resources. However, the survey work is costly and previously presented power analyses have suggested that surveys conducted at a frequency of once every three years may be sufficient to detect reasonable levels of change in seabird abundance. Thus, the panel felt that annual surveys as proposed are not warranted, and that postponing the start of less-frequently conducted potential future surveys would not be of great issue. The panel also found that methods and justification with respect to synthesis and modeling objectives were not sufficiently detailed or developed. The panel suggests that the proposal be reduced in scope (i.e. less frequent survey intervals, possible reduced modeling effort) and submitted for consideration in future funding cycles.

Science Panel Recommendation: Do Not Fund

Science Director Comments:

The Science Director is on a long-term detail from the FWS and must therefore, recuse herself from making recommendations on FWS proposals. The PI on this proposal is employed by the FWS.

Total Funding Approved: \$649,700.00

Abstract:

This proposed study would investigate the efficacy of direct restoration techniques for the Pigeon Guillemot population in Prince William Sound. This seabird is the only EVOS injured species that has failed to show any signs of recovery. The post-EVOS guillemot population in PWS is only 15% of the pre-EVOS population; about one-third of PWS guillemots nested on Naked Island pre-EVOS. Post-EVOS, mink predation was identified as a limiting factor for recovery of Naked Island guillemots. We propose testing the hypothesis that mink were introduced to the Naked Island Archipelago by fur trappers and, if not, determine if the mink population on the Naked Island Archipelago a distinct population segment. We also propose investigating the feasibility and efficacy of removing mink from the Naked Island Archipelago as a restoration activity for Pigeon Guillemots. In addition, we propose testing the hypotheses that (1) nest predation by mink continues to be a major limiting factor for guillemot recovery at Naked Island, and (2) the availability of key prey resources does not limit guillemot nesting success at Naked Island. A final report will be prepared upon completion of the two years of field and lab work that will propose the most effective and justifiable plan for management action to restore Pigeon Guillemots in the Naked Island Archipelago.

Science Panel Comments:

This proposal investigates the efficacy of direct restoration techniques for the pigeon guillemot population in PWS. They will genetically sample mink that reside on Naked Island Archipelago to determine if the population was introduced or native and make recommendations for a recovery plan for pigeon guillemots based on the findings. Pigeon guillemots are one of two non-recovered species and this project represents one of the few restoration based proposals that have been submitted. The genetic sampling of mink and studies examining the relative contribution of mink vs. other predators to pigeon guillemot survival and reproduction are important in evaluating mink removals as a potential restoration activity. However, there is some concern that removal of mink may not be an appropriate restoration activity if the mink are in fact native. Also, food limitation studies may be difficult to interpret with respect to restoration and are perhaps premature. Mink removal may still prove an effective restoration tool even if food quality is poor. Furthermore, given the likely annual variation in food supply, a lack of food in one year may not be a reasonable predictor of future food limitation. We recommend funding the initial year of this proposal and suggest that efforts be made to provide genetic evidence on mink at the end of that year so that reasoned decisions can be made regarding future funding

Science Panel Recommendation: Fund Reduced

Science Director Comments:

The Science Director is on a long-term detail from the FWS and must therefore, recuse herself from making recommendations on FWS proposals. The PI on this proposal is employed by the FWS.

Science Director Recommendation: Not Reviewed

Public Advisory Committee Comments:

Not Applicable

Public Advisory Committee Recommendation: Not Reviewed

Executive Director Comments:

Salaries and logistics are the major expenses of this proposal. Assuming mink predation on pigeon guillemots, any direct restoration will likely involve controlling the mink population on Naked Island. Before this can be undertaken a determination must be made whether the mink population is indigenous or introduced. Therefore, I only recommend funding the minimum mink capture and genetic testing program necessary to determine where the population is indigenous or introduced. I further recommend local trappers and logistics be utilized in this effort to reduce expense.

Project Number: 070810
Project Title: An Ecosystem Model of Prince William Sound Herring: A Management & Restoration Tool
Principal Investigator: Dale Kiefer
Affiliation: Non AK University
Disbursing Agency: NOAA
Project Location: Analysis/Modeling of data from Prince William Sound & Gulf of Alaska
Project Type: New

Funding Approved by Fiscal Year:

FY07: \$250,800.00	FY08: \$250,800.00	FY09: \$250,800.00
FY10: \$0.00	FY11: \$0.00	FY12: \$0.00

Total Funding Approved: \$752,400.00

Abstract:

Over a three-year period, we propose to develop a life-stage specific, ecosystem based model of the Prince William Sound (PWS) herring that will aid in the integration of ecological data that has been gathered on herring over the last 2 decades, evaluation of proposed restoration activities, and attempt to simulation of the processes that cause the chronic decrease in herring stocks since the 1989 spill. More specifically, it will be used to test the unresolved hypotheses of why the herring have not recovered to pre-spill densities. The model and associated data will be housed in a geographic information system that we have developed specifically for marine applications. The geo-spatial information from field surveys and simulations with the model will available for interactive viewing and downloading of files over the Internet.

The model will provide a mathematical description of the population dynamics of annual herring cohorts as they mature through their life stages. In particular we will focus on arrival of larvae to the Bays of PWS, the maturation and survival of juveniles in these bays, and the survival and reproductive success of adults as they move seasonally from spawning grounds, feeding grounds and wintering grounds. The system of coupled differential equations that describe these processes will be tuned to prove a best fit between model calculations and field and laboratory measurements. In its final form the model will consist of 3 sets of such equations that will simulate the unique conditions found in herring habitats of the eastern, northern and southwestern regions of PWS. Most importantly, the model will be formulated according to the principals of the trophic trap in which 2 metastable states for herring exist, low-density and high-density. We propose that a sequence of events following the spill drove the herring from high-density to low-density and a trophic trap prevents stocks from recovering. Thus, we will tune our model to both high-density and low-density states and then run the tuned models in the forward or backward direction to identify both the most probable causes of the injury and the most promising approaches to restoration.

Our team has the scientific and technical experience to succeed, and we will work closely with researchers from the other herring projects, especially those working on larval drift, disease, otolith marking, and intervention. Our web-based system will promote such collaboration particularly with such groups as PWSFRAP and with the PWS Science Center.

Science Panel Comments:

This proposal is one of the most original and synthetic of the proposals reviewed. The predictive capability of the proposed model makes it a valuable tool for examining population dynamics of herring. This project could provide a central data gathering point for several of the other, more detailed, modeling proposals. The Panel suggests that the PIs accelerate the model development, such that it would be useable to assess efficacy of various potential restoration methods. The Panel was concerned that the model is inextricably linked with the patented EZ software system and wants to ensure that the model could stand alone as a predictive tool.

Science Panel Recommendation: Fund

Science Director Comments:

Concur with Science Panel. The PI will need to work directly with the data management staff at the Trustee Council office to create a web-based product that is user-friendly and available to the public. The life-stage model will be useful in understanding how different stressors affect the PWS herring population, which until now has not been developed.

Data Systems Manager Comments: Defer: This project proposes to develop a comprehensive herring model for PWS based upon the previous work of Evelyn Brown and others. The PIs also propose to work with Vince Patrick to enhance the accuracy of the model by applying concepts learned at PWSFRAP when implementing the pink salmon model. They propose to house and run the model using the EASy GIS software system and to install this product on the EVOS server.

Though I am not a mathematical modeler, and thus cannot evaluate the proposal at that level, I do think that the conceptual modeling approach is responsive to the invitation and potentially valuable. However, I think this proposal may be a case of “too much too soon” for several reasons. First, a final report has not been received or peer reviewed for project 060784 (Adams FY06), which involved implementation of the pink salmon survival model. It would be good to evaluate the results of this project before embarking on a new modeling effort partially based upon it. Secondly, I like the idea proposed in the Moffitt proposal of building a centralized data portal for housing herring research data. I feel that first bringing together herring research data into a centralized electronic system will improve the availability of herring data and result in the building of better models and GIS systems. Thirdly, I recently met with Vardis Tsontos to install the GIS system software produced in project 040710. The product showed promise, but we encountered some technical problems with the software. These issues appeared to be due mostly to slight differences between the server configurations here at EVOS and the environment under which the software was developed. Though I am confident the technical issues will be worked out (currently waiting on their database manager for a resolution), I would like to get the opinion of other scientists who might use the completed EASy GIS product as to its usefulness before we commit substantial resources towards development of additional products based upon it. The budget for this project is rather large, and I would also like to explore the question of GIS software standardization in the EVOS office before we commit to development of this system.

Project Title: Prince William Sound Herring Forage Contingency, Submitted Under the BAA
Principal Investigator: Thomas Kline
Affiliation: NGO
Disbursing Agency: NOAA
Project Location: Prince William Sound and Adjacent Gulf of Alaska
Project Type: New

Funding Approved by Fiscal Year:

FY07: \$262,000.00	FY08: \$0.00	FY09: \$0.00
FY10: \$0.00	FY11: \$0.00	FY12: \$0.00

Total Funding Approved: \$262,000.00

Abstract:

Prince William Sound (PWS) herring recruitment is hypothesized to be contingent on young of the year herring attaining from zooplankton sufficient whole body energy content (WBEC) to survive their first winter. PWS recruitment is presently variable, having changed since the Trustee Council funded Sound Ecosystem Assessment (SEA) project ended. Juvenile herring will be sampled and analyzed for WBEC and natural stable isotope abundance (SIA) for comparison with SEA data. The PI has direct familiarity with WBEC and SIA done during SEA enabling duplication. Oceanic subsidies (detected with SIA) are hypothesized to augment zooplankton energy density, which varies in time and locations. High zooplankton energy density is hypothesized to enable herring to acquire high WBEC in certain areas at certain times. To test these hypotheses, herring forage will be assessed in terms species composition and density, SIA, and energy density, which will be related to herring WBEC by location and time.

Project Number: 070805
Project Title: ShoreZone Mapping for Prince William Sound
Principal Investigator: Mandy Lindeberg
Affiliation: NOAA
Disbursing Agency: NOAA
Project Location: Prince William Sound
Project Type: New

Funding Approved by Fiscal Year:

FY07: \$237,900.00	FY08: \$322,300.00	FY09: \$0.00
FY10: \$0.00	FY11: \$0.00	FY12: \$0.00

Total Funding Approved: \$560,200.00

Abstract:

This proposal will continue ShoreZone mapping in Prince William Sound (PWS), Alaska. Approximately 8,400 km of shoreline has been mapped in the central Gulf of Alaska, including 1,600 km of shoreline in western PWS in 2004. The majority of the spill area inside PWS, including Knight island area and all of northern and eastern PWS have not been mapped. To support both future oil remediation efforts as well as restoration activities, such as possible herring intervention programs like moving spawn to rearing areas, would be supported by a single mapping protocol that included geomorphology, substrate type, as well as the biological substrate on all beaches. Completing PWS would fill the gap by providing a contiguous data set from across the entire spill area using a standard protocol. Most importantly, this data set will be useful to managers, as it combines photographs of the entire beach area, as well as having a data set that can be sorted by location, substrate type, and other factors. The ShoreZone data set is recognized as a significant tool for oil spill response planning, identifying essential fish and wildlife habitat, and for monitoring long-term changes in coastal habitat that may result from development, restoration, or even global climate change. Three 6-day aerial video imagery surveys (about 4,000 km of shoreline), mapping, ground-truthing, and nearshore fish sampling are proposed. Aerial video imagery would be completed in the first summer, mapping in the following winter, with ground truthing/fish sampling at a limited selection of sites the following summer.

Science Panel Comments:

This proposal provides Sound-wide data on important physical and biological characteristics of the environment that would be applicable to herring restoration, as well as lingering oil issues and injured resource recovery. The Panel did not see the value in the fish sampling effort and suggested its removal, along with a reduction in the amount of ground-truthing proposed. A great deal of information is already known about the PWS, and the field effort should be enough to validate the aerial surveys. However, it is not necessary to cover such a large proportion of the area. The cost seemed high, but with a reduction in the field effort this project should be more cost effective.

Science Panel Recommendation: Fund

Science Director Comments:

Concur with Science Panel. The information derived from this project will be applicable to most injured resources and services, especially those reliant on the nearshore environment. The fish collections should be removed, the number of ground-truthing events reduced and costs trimmed accordingly.

Project Number: 070821
Project Title: Development of Culture Technology to Support Restoration of Herring in Prince William Sound: Use of In Vitro Studies to Validate and Optimize Restoration Actions
Principal Investigator: Timothy Linley
Affiliation: Private Enterprise
Disbursing Agency: ADFG
Project Location: Prince William Sound, Resurrection Bay
Project Type: New

Funding Approved by Fiscal Year:

FY07: \$92,700.00	FY08: \$0.00	FY09: \$0.00
FY10: \$0.00	FY11: \$0.00	FY12: \$0.00

Total Funding Approved: \$92,700.00

Abstract:

Intervention in the form of artificial propagation may be needed to restore Prince William Sound (PWS) herring to levels capable of supporting a healthy ecosystem as well as sustainable fisheries. We propose to test and refine propagation methods through laboratory and field studies over a three year period to evaluate the likely benefits and costs of stock restoration. The overall objective is to obtain biological and economic benchmarks of stock enhancement strategies by integrating established techniques for laboratory rearing of herring with state of the art methods used in the culture of multiple marine species. Our specific efforts will focus on the role of calcium sensing receptor proteins in herring osmoregulation, nutrition and immune function. The results will provide PWS stakeholders and other researchers with improved understanding of the optimal husbandry and nursery conditions for herring stock enhancement, and the potential effects of such restoration on PWS herring.

Science Panel Comments:

If direct enhancement or other types of intervention is a likely direction that a herring restoration program will pursue, then captive rearing and propagation of herring will be needed. This proposal is the only project that seeks to develop culture techniques suitable for herring in Alaska. The PIs have a great deal of experience with fish culture (mostly salmon), but it is unclear how much experience they have with herring. Herring culture techniques have been successfully implemented in Japan, and the panel believes that the PIs would benefit from learning how those methods that can be used in Alaska. Therefore, they recommend a reduction in the first year of funding to \$60,000 for the PI's to collaborate with the Japanese on herring culture techniques. In the second year, the PI's should submit a reworked proposal. They should remove the calcium receptor gene objective, because it is unclear how that relates to herring. They should consider a larger range of environmental factors in their culture methods and analyze their effects on growth and survival. The PIs also need to define a source for their captive fish, describe how they will consider the role of disease in their work and resolve permitting issues.

Science Panel Recommendation: Fund Reduced

Science Director Comments:

Concur with Science Panel. If direct intervention or enhancement activities are eventually recommended for PWS herring, an understanding of culture techniques and large-scale production will be necessary. The PIs have experience in fish culture, (although their experience with herring is not clear in the proposal), and the Alaska SeaLife Center will provide an excellent facility to establish this program. The Japanese have a great deal of experience with commercial scale herring production, and their experience would benefit any program initiated in Alaska. Therefore, the PIs should take advantage of one-year seed funding to present a proposal that incorporates established techniques.

Project Number: 070742
Project Title: Monitoring, Tagging, Feeding Studies, and Restoration of Killer Whales in Prince William Sound/Kenai Fjords in 2007
Principal Investigator: Craig Matkin
Affiliation: NGO
Disbursing Agency: NOAA
Project Location: Prince William Sound/Kenai Fjords
Project Type: New

Funding Approved by Fiscal Year:

FY07: \$99,400.00	FY08: \$0.00	FY09: \$0.00
FY10: \$0.00	FY11: \$0.00	FY12: \$0.00

Total Funding Approved: \$99,400.00

Abstract:

The proposed project is an amendment to the previously funded project that addresses lingering effects of the Exxon Valdez oil spill by continuation of the monitoring of AB pod and the AT1 population killer whale populations in Prince William Sound. These groups of whales suffered serious losses at the time of the spill and have not recovered at projected rates. This proposal seeks to extend the scope of work to include an innovative satellite tagging program to examine habitat preference and to aid in a more extensive examination of feeding habits using observational and chemical techniques. Results will allow us to more closely examine the potential for restoration. The project will more clearly delineate the role of killer whales in the nearshore ecosystem and possible effects on the restoration recovery of harbor seals and sea otters. Community based initiatives such as Youth Area Watch and educational programs for tour boat operators educational programs will continue to be integrated into the work to help foster restoration by improving public understanding and reducing harassment of the whales.

Science Panel Comments:

The proposal asks for additional funds to employ a new method for tagging killer whales. The panel found this to be a very exciting opportunity that is likely to greatly enhance our ability to evaluate recovery status of killer whales and recommends funding. The panel's only additional recommendation is that the use of tags might afford opportunities to conduct winter observations of feeding, and that these might be considered for inclusion as the methods are more fully developed.

Science Panel Recommendation: Fund

Science Director Comments:

Currently, identifying and tracking killer whales in and around the spill area is based on observational methods. Tracking whales over large areas and understanding where and how they spend the majority of their time is measured by how frequently the investigators encounter whales and how long they are able to watch them. The proposed technique would allow the principal investigator to remotely track whales throughout their home range, which includes a much bigger area than can be reasonably covered by small boat. This will provide much needed life-history information on an injured resource.

Project Title: Identification of Essential Habitat for Pacific Herring (*Clupea Pallasii*) in Sitka Sound for Comparison to Prince William Sound i.e. Source vs. Sink Habitat– Submitted under the BAA
Principal Investigator: Heather Meuret-Woody
Affiliation: NGO
Disbursing Agency: ADFG
Project Location: Sitka Sound, Sitka Alaska
Project Type: New

Funding Approved by Fiscal Year:

FY07: \$166,400.00	FY08: \$0.00	FY09: \$0.00
FY10: \$0.00	FY11: \$0.00	FY12: \$0.00

Total Funding Approved: \$166,400.00

Abstract:

Once herring hatch and the larvae drift to retention areas, they begin metamorphosis. As juveniles, herring forage in productive waters of the North Pacific. Adult herring then return to natal beaches to spawn. What is unknown is where the herring go and if certain regions contribute more to the spawning population. Once we know which population contributes more to the spawning groups, we can then identify those variables that enhance the life histories of the source population. We can identify these groups and track their movements using otolith chemistry. The adult herring that return to spawn are the survivors. If most of the survivors come from a distinct population, then we need to know which population survive and why. This will allow managers to protect the most important populations and also identify those environmental variables needed to enhance other populations.

Project Number: 070801
Project Title: Assessment of the Areal Distribution and Amount of Lingering Oil in Prince William Sound and the Gulf of Alaska
Principal Investigator: Jacqueline Michel
Affiliation: Private Enterprise
Disbursing Agency: NOAA
Project Location: Prince William Sound and the Gulf of Alaska (Kenai Peninsula and Kodiak Strait)
Project Type: New

Funding Approved by Fiscal Year:

FY07: \$1,465,500.00	FY08: \$128,600.00	FY09: \$0.00
FY10: \$0.00	FY11: \$0.00	FY12: \$0.00

Total Funding Approved: \$1,594,100.00

Abstract:

The proposed study is to develop and implement a statistically rigorous field study and spatial modeling analysis to produce maps showing the probability of lingering oil in areas of Prince William Sound and the Gulf of Alaska that were affected by the Exxon Valdez oil spill. We will also estimate the area and volume of oiled sediments in these areas as of 2007. Sediment samples will be analyzed to fingerprint the source of the oil residues, characterize them as to the degree of weathering and risk to exposed biota, and determine treatability using bioremediation. The results will provide key data for use in developing more detailed remediation plans and priority areas for remediation. The probability maps will allow researchers to identify locations where oil persists with much greater precision, leading to more sensitive studies of the long-term effects of the lingering oil on biota in the spill-impact regions.

Science Panel Comments:

The study will provide information critical to restoration, is well designed, and is to be conducted by qualified investigators with a strong track record at a reasonable cost. The panel recommends that the work be funded. The panel did have some questions regarding the qualifications of persons responsible for the modeling and statistical analyses. These should be explicitly identified and a resume provided for Dr. Pella who it appears will play a key role with respect to these aspects of the project. Also, it is unclear as to if or how the extent of oil on armored beaches will be evaluated. As described, the methods described do not appear applicable to sampling in these potentially important habitats. If necessary, the design should be modified to incorporate these.

Science Panel Recommendation: Fund

Science Director Comments:

The location, distribution and amount of lingering oil remaining in the spill area are key questions that may influence all future activities related to the restoration program. The PIs have excellent qualifications and the expertise to conduct this project.

Science Director Recommendation: Fund

Project Number: 070822
Project Title: Herring Data and Information Portal
Principal Investigator: Steven Moffitt
Affiliation: State Of Alaska
Disbursing Agency: ADFG
Project Location: Prince William Sound
Project Type: New

Funding Approved by Fiscal Year:

FY07: \$132,100.00	FY08: \$0.00	FY09: \$0.00
FY10: \$0.00	FY11: \$0.00	FY12: \$0.00

Total Funding Approved: \$132,100.00

Abstract:

This project will consolidate, document, and enter data sets, metadata, and other electronic resources into a web portal. The web portal will provide public access to information, data, and GIS visualizations. Scientist and researchers will utilize the web portal as a resource to assist in consolidating, accessing and synthesizing herring data. This project will also develop an ArcPad application for collecting herring aerial survey data directly into a GIS format. The project was conceived during an EVOS sponsored workshop in April 2006 that was tasked to identify Prince William Sound herring data gaps and develop restoration or research projects to help herring recovery. Participants indicated that knowledge of the spatial and temporal aspects of herring related data sets, e.g., herring spawn, was necessary to understand how restoration activities might affect herring abundance trajectories. Currently there are many herring related data sets that are not easily accessible to restoration researchers and managers. Several restoration projects proposed at the April 2006 meeting would require spatial and temporal knowledge of herring data as input to a model or as a measure of the success of a restoration project. This project would provide easier access and visualization of selected herring data sets and other electronic resources.

Science Panel Comments:

This is a strong proposal that is well written and responsive to the Invitation. The web portal could be used by managers, researchers and the public, and it would provide a central location for historical data. The panel recommends that the PI coordinate his efforts with work proposed by Kiefer (if funded), and determine how the database should be populated. As submitted, the proposal only identifies funds for an IT professional and a graphic designer. For this project to be useful the database needs to be populated and managed, however no funds are requested for data gathering or management of the system. The Panel recommends that additional budget items should include funds for populating the database after the structure is created and management of the system. The PI should also explain how this project can be incorporated into the larger EVOS database.

Science Panel Recommendation: Fund

Science Director Comments:

Fund Contingent. The PI must work closely with the EVOS data management staff to ensure a product that is user friendly and available to the public. Additionally, two specific areas should be addressed prior to funding commitments: 1) Population of the data base with historic information and 2) Long-term maintenance of the database (i.e, not the system but the data). This project will only be useful if it data is incorporated into the system, such that it is available to managers, researchers and the public. Also, the data needs to be updated periodically, so it does not become obsolete. This will be a valuable tool as the Trustees move forward with herring recovery, but only if it is maintained with current information.

Data Manager Comments: Modify and fund portal portion. Defer GIS component The PIs propose to develop a web-based portal for storage of herring data and metadata. They also propose to develop GIS visualizations of stored data, and to develop an application using ArcPad for collecting herring data in a GIS compatible format.

This project responds well to the invitation in that it brings together herring data from multiple sources and makes it available for further additional research, modeling, and GIS development. While I support the development of the herring data portal, I feel that this data system should be housed on EVOS database and web servers. This will ensure its continued availability after FY07 regardless of the Trustee Council's future funding priorities and decisions. I also recommend that the GIS component of the proposal be deferred until decisions can be made regarding standardization of GIS systems for EVOS.

Project Number: 070290
Project Title: The Exxon Valdez Trustee Hydrocarbon Database
Principal Investigator: Bonita Nelson
Affiliation: NOAA
Disbursing Agency: NOAA
Project Location: Project: Auke Bay Lab JNU,AK. Service: entire spill area via internet
Project Type: New

Funding Approved by Fiscal Year:

FY07: \$30,100.00	FY08: \$0.00	FY09: \$0.00
FY10: \$0.00	FY11: \$0.00	FY12: \$0.00

Total Funding Approved: \$30,100.00

Abstract:

This project is an on-going service project providing data and sample archiving services for all samples collected for hydrocarbon analysis in support of Exxon Valdez Oil Spill Trustee Council projects. These data represent samples collected since the oil spill in 1989 to the present and include environmental and laboratory Response (National Resource Damage Assessment - NRDA) and Restoration data. Additionally, we provide interpretive services for the hydrocarbon analysis, provide public releases of the database (including FOIA requests) and maintain the hydrocarbon sample archives.

Science Panel Comments:

This proposal provides ongoing support for maintaining, updating, and serving hydrocarbon data that are critical to future evaluations of recovery and restoration. We recommend funding. The only recommendation of the panel was that the web interface be updated in consultation with EVOS Trustee Staff to ensure that it is compatible and non-duplicative with other ongoing web server tasks.

Science Panel Recommendation: Fund

Science Director Comments:

This database is a long-term project that has been funded by the TC. It provides a storage and archival repository for hydrocarbon data generated from projects centered in the spill-affected area.

Data Manager Comments: Fund This proposal provides for the continued sample archiving and maintenance of the hydrocarbon database at the Auke Bay Lab in Juneau. This proposal represents the continuation of an effort that has been ongoing since 1993. The PIs also propose to improve the accessibility of the data through the web.

This proposal provides the Trustee Council a good cost sharing opportunity, and the cost is quite reasonable for services provided. I look forward to providing a link to this hydrocarbon database from our website when the upgrade is completed.

Project Title: Using Otolith Chemistry to Discriminate Pacific Herring Stocks in AK
Principal Investigator: Edward Otis
Affiliation: State Of Alaska
Disbursing Agency: ADFG
Project Location: Gulf of Alaska
Project Type: New

Funding Approved by Fiscal Year:

FY07: \$66,400.00	FY08: \$0.00	FY09: \$0.00
FY10: \$0.00	FY11: \$0.00	FY12: \$0.00

Total Funding Approved: \$66,400.00

Abstract:

This proposal is an extension of EVOS Project 050769, which is currently assessing the temporal stability of stock discrimination criteria derived from fatty acid analysis (FAA) of herring cardiac tissues. In 2006, Otis (050769) collected heads from fish sampled for FAA so chemical analysis of the otoliths could be conducted to evaluate which technique was most effective for determining herring stock structure at fine spatial scales. In this study, Dr. Nate Bickford (EVOS Project 060782) will process those samples using laser ablation-inductively coupled plasma-mass spectrometry (LA-ICP-MS) to determine whether otolith chemistry can be used to corroborate FAA techniques for determining fine scale structuring within and among Alaska's herring stocks (e.g., Sitka, PWS, Kamishak, Kodiak, Dutch Harbor, Togiak, and Kuskokwim Bay). Results will be published and should allow researchers to better define ecologically significant stock boundaries, likely affecting how commercially exploited herring populations are assessed and managed.

Science Panel Comments:

This project proposes to analyze otoliths from fish collected from a previous TC-funded study. Therefore, the samples are already 'in-hand' and the project would be very cost-effective. The method provides a corroborating technique (along with fatty acid analysis) that will assist managers in identifying herring stock boundaries, thus the direct management applications are strong.

Project Number: 070804
Project Title: Significance of Whale Predation On Natural Mortality Rate of Pacific Herring in Prince William Sound
Principal Investigator: Stanley Rice
Affiliation: NOAA
Disbursing Agency: NOAA
Project Location: Prince William Sound, Sitka Sound, and southern Lynn Canal
Project Type: New

Funding Approved by Fiscal Year:

FY07: \$197,700.00	FY08: \$0.00	FY09: \$0.00
FY10: \$0.00	FY11: \$0.00	FY12: \$0.00

Total Funding Approved: \$197,700.00

Abstract:

Pacific herring (*Clupea pallasii*) in Prince William Sound (PWS) have been classified as “not-recovered” by the Exxon Valdez Oil Spill Trustee Council. Predation by marine mammals has been cited as a factor in the failure of this population to rebound. We will assess the significance of humpback whale predation on herring in PWS, particularly in winter. Specifically we will estimate the number of whales foraging in winter, determine when and if there is a prey switch to herring, and how long whales focus on herring as prey. Year one, is stand alone, small in scale with an intense monitoring strategy; year 2 would expand the scale up in area significantly. These data will be combined in a bioenergetic model to determine numbers of herring consumed (and energy content consumed). Lastly, the estimated numbers of herring consumed would be included in an age-structured model so that the significance of whale predation on herring recovery can be evaluated.

Science Panel Comments:

This proposal is responsive to the Invitation and the PIs are well qualified. Predator impacts on herring, especially in winter, are poorly understood and need to be quantified. The number of whales over-wintering in PWS is growing each year, and it is important to understand their contribution to the population dynamics of herring as part of a successful restoration program. This proposal also incorporates comparisons in whale predation among multiple sites (southeast vs. PWS) with both depressed and healthy populations of herring.

Project Number: 070759
Project Title: Harlequin Duck Population Dynamics in Prince William Sound: Measuring Recovery from the Exxon Valdez Oil Spill
Principal Investigator: Daniel Rosenberg
Affiliation: State Of Alaska
Disbursing Agency: ADFG
Project Location: Prince William Sound
Project Type: New

Funding Approved by Fiscal Year:

FY07: \$86,700.00	FY08: \$0.00	FY09: \$0.00
FY10: \$0.00	FY11: \$0.00	FY12: \$0.00

Total Funding Approved: \$86,700.00

Abstract:

This project will monitor the recovery of harlequin ducks and is directly linked to recovery objectives in the EVOS Restoration Plan. The outlook for recovery is improving, however, oil remains in the intertidal, ducks are exposed to oil, populations in oiled areas while no longer declining have not increased more than those in unoiled areas, and proportions of females in oiled areas remain lower than reference areas. This suggests a lack of full recovery. We will conduct winter boat surveys to test if harlequin ducks have recovered from the EVOS by comparing population structure and trends between oiled and unoiled treatments in four areas (2 oiled, 2 unoiled) of PWS. Similar structure and increasing trends in oiled areas, when interpreted with complimentary data, will indicate recovery status. Work will be complimentary to studies addressing lingering oil, cytochrome P450 induction, and population modeling to provide a more comprehensive assessment of recovery.

Science Panel Comments:

The proposed project will extend long-term data sets on winter abundance of seabirds that is especially critical to the continued evaluation of injury and recovery of harlequin ducks. We recommend this project be funded. However, the panel recommends that funding beyond FY07 be dependent upon several conditions. First, the investigator should provide data on species other than harlequin ducks that are presumably counted in the surveys. These may provide very valuable information on other nearshore species such as goldeneye which have recently demonstrated indications of oil exposure. Also, there should be a concerted effort to collaborate with others conducting bird surveys, such that there is a sharing of data and lack of duplicative survey efforts.

Science Panel Recommendation: Fund

Science Director Comments:

A continuation of this project will provide information on the demographics of harlequin duck populations in oiled and unoiled areas of the Sound. It will also funnel data into projects that propose to synthesize existing harlequin information into a comprehensive population dynamics model. If the investigator collects data on seabirds other than harlequin ducks, those data should be presented to the TC at the end of this project...historical data on seaduck counts that have been generated from previously funded projects should also be analyzed and presented to the Trustees.

Project Number: 070210
Project Title: Youth Area Watch - PWS
Principal Investigator: Sheryl Salasky
Affiliation: NGO
Disbursing Agency: ADFG
Project Location: Prince William Sound; Resurrection Bay
Project Type: New

Funding Approved by Fiscal Year:

FY07: \$104,500.00	FY08: \$0.00	FY09: \$0.00
FY10: \$0.00	FY11: \$0.00	FY12: \$0.00

Total Funding Approved: \$104,500.00

Abstract:

Youth Area Watch (YAW) is designed to involve students in working with scientists while making a meaningful contribution to research &/or restoration in oil spill affected communities. Youth are trained by scientists to design and conduct long term monitoring projects. In addition to learning current scientific sampling and research techniques (as mandated by Alaska State & National Science Standards), they return to their villages and survey community members for input toward designing a local environmental monitoring and/or restoration project. Youth Area Watch fosters long-term commitment to the goals set out in the Restoration Plan of 1994 and offers a positive community investment in that process. Participating communities in FY 07-09 will be Chenega Bay, Cordova, Tatitlek, Valdez, Whittier, Anchorage and Wasilla.

Science Panel Comments:

The proposal provides important educational opportunities in spill affected communities and is important for restoring injured resources. This is an ongoing program and we recommend continued funding. However, the panel was concerned that much of the funding was being directed toward coordinators that are located outside of the spill area and not toward resources within spill affected communities. Also, the panel felt that there had not been adequate review of results from previously funded projects. While the panel understands the concerns regarding budgeting based on a single year's funding, they recommend that the project be funded for one additional year, and that future funding be contingent on a thorough review of past project performance.

Science Panel Recommendation: Fund Reduced

Science Director Comments:

Educational opportunities in the communities are an important way for the TC to promote awareness, understanding and participation in restoration activities of injured resources and services. Thus, the TC should continue funding projects of this type. However, it is also necessary to evaluate the priorities, goals and direction of such programs after they have been in operation for several years to ensure they are in alignment with TC restoration goals. This project should be funded for the upcoming fiscal year and during that time, a review and assessment of the program should be conducted between the YAW Directors and the Executive Director of EVOS TC office. This review should summarize past performance of the program, but should focus on future direction of YAW and the integration of EVOS science/restoration projects and the YAW program.

Science Director Recommendation: Fund Reduced

Public Advisory Committee Comments:

Not Available

Public Advisory Committee Recommendation: Do Not Fund

Executive Director Comments:

There are 16 spill-affected native communities and I would rather this program target youth participation in these communities--not just Chenega Bay, Tatitlek, Cordova, Valdez, Whittier, Anchorage, Wasilla, and Talkeetna. The co-Pis reside in Talkeetna and Anchorage, respectively. Focusing the program on the spill-affected communities would also bring into play the socio-cultural dynamics within the villages and link directly with the subsistence way of life apparently missing in this proposal. By focusing on the village, there would also be the interaction of both western science and traditional knowledge and between youth and elders--again missing in the proposal. An example is the Mineral Creek Star Park Recreation Site which reads more like a field trip--I do not want this proposal to continue with projects that have been developed and "lesson plans" in place. There are new proposals with subsistence and food safety issues identified and this proposal needs to link with these efforts at the village level.

This project makes good use of other funding sources. The proposal does not detail the contributions of the program to science or the decision-making process--the projects lack any detail allowing an assessment of their usefulness. This proposal initially states the project participants are junior and senior high school students but later reference middle and high school students--which is it? My preference is for the broader range of student participation. The GEM reference is outdated. I do not agree with EPA facilitation and want this changed to Trustee Council agency facilitation.

Trustee Council Decision: Fund

Project Number: 070610
Project Title: Kodiak Archipelago Youth Area Watch
Principal Investigator: Theresa Schneider
Affiliation: NGO
Disbursing Agency: ADFG
Project Location: Kodiak Archipelago
Project Type: New

Funding Approved by Fiscal Year:

FY07: \$75,600.00	FY08: \$0.00	FY09: \$0.00
FY10: \$0.00	FY11: \$0.00	FY12: \$0.00

Total Funding Approved: \$75,600.00

Abstract:

The Kodiak Archipelago Youth Area Watch is an ongoing community involvement project designed to engage students in projects with goals aligned with the general restoration efforts of the Trustee Council. Students and site coordinators will conduct interviews with local experts and document TEK, while taking part in locally relevant research projects. Participation of KAYAW adults and students in the annual Academy of Elders/Science Camp will be strongly encouraged. Participants will share their research during regional gatherings and within District publications. Such participation will serve as another avenue for more tribal members to learn about restoration efforts, scientific monitoring techniques, and occupations related to such work. Students will explore local knowledge as it relates to marine mammal populations, inter-tidal environment, and the impact of humans on the coastal environment, human use overtime and intergenerational changes and cultural beliefs and practices that may provide insight in scientific studies. Student interns will be hired during the summer months to work directly with archaeologists and anthropologists in a community archeological dig in coordination with the Alutiiq Museum. The value and implications of TEK will be strongly emphasized throughout the implementation of the KAYAW project.

Science Panel Comments:

The proposal provides important educational opportunities in spill affected communities and is important for restoring injured resources. This is an ongoing program and we recommend continued funding. However, the panel was concerned regarding the lack of linkages between the youth area watch program and EVOS scientists or programs. While this may not be the fault of the Kodiak YAW program, these linkages should be fostered. Also, the panel felt that there had not been adequate review of results from previously funded projects. While the panel understands the concerns regarding budgeting based on a single year's funding, they recommend that the project be funded for one additional year, and that future funding be contingent on a thorough review of past project performance.

Science Panel Recommendation: Fund Reduced

Science Director Comments:

Educational opportunities in the communities are an important way for the TC to promote awareness, understanding and participation in restoration activities of injured resources and services. Thus, the TC should continue funding projects of this type. However, it is also necessary to evaluate the priorities, goals and direction of such programs after they have been in operation for several years to ensure they are in alignment with TC restoration goals. This project should be funded for the upcoming fiscal year and during that time, a review and assessment of the program should be conducted between the YAW directors and the Executive Director of EVOS TC office. This review should summarize past performance of the program, but should focus on future direction of YAW and the integration of EVOS science/restoration projects and the YAW program.

Public Advisory Committee Recommendation: Do Not Fund

Executive Director Comments:

This youth area watch proposal addresses my concerns for native village youth-elder participation but lack projects. The projects are workshops, training, elder interviews... The proposal states if opportunists research project occurs, then the effort will be made to coordinate interactions. I believe this and the Salaski-youth area watch proposal have both become to expecting of Trustee Council funding.

I believe both efforts should be combined and specific youth-oriented restoration-related projects be proposed. Until then, I do not recommend funding for either proposal.

This proposal does focus on the youth within select spill-area communities. Again, I sense the activities have become routine. One of the other components is nearshore monitoring and the results of this activity are not linked to restoration.

The specifics are lacking and from the proposal text, it is clear the respective PI's (Schneider and Salaski) worked together and should have linked their efforts more directly. Both should be linked at a minimum with subsistence proposals--ongoing and proposed.

Project Number: 070829
Project Title: Bioavailability and Effects of Lingering Oil to Littleneck Clams (*Protothaca Staminea*) and Population Recovery Status in Prince William Sound
Principal Investigator: Gary Shigenaka
Affiliation: NOAA
Disbursing Agency: NOAA
Project Location: Prince William Sound, AK and Kasitsna Bay, AK
Project Type: New

Funding Approved by Fiscal Year:

FY07: \$239,900.00	FY08: \$0.00	FY09: \$0.00
FY10: \$0.00	FY11: \$0.00	FY12: \$0.00

Total Funding Approved: \$239,900.00

Abstract:

We will determine the biological availability and effect of Exxon Valdez lingering oil to littleneck clams, *Protothaca staminea*. Results of laboratory exposures of *P. staminea* to oiled sediment collected in Prince William Sound will be compared to results from individuals collected in situ at known oiled and unoiled sites. Molecular biomarker assays and tissue histology will be used to determine effects of lingering oil to growth, reproduction, and other physiological endpoints in the exposed clams. This information will be paired with a field assessment of clam abundance at sites surveyed in the 1990-2000 NOAA long-term monitoring program in Prince William Sound to determine if recovery endpoints that had not been met in the year 2000 have been attained in 2007.

Science Panel Comments:

The proposal seeks to conduct sampling of littleneck clams at sites previously sampled by NOAA and includes evaluation of a variety of metrics including abundance, size, age, PAH in tissue, histopathology, and various biomarkers. The panel sees potential utility in examining abundance and size distributions, but much of the funding is directed toward other metrics that we see as having less value. Previous studies conducted shortly after the spill by Trowbridge failed to demonstrate any effects of oiling on histopathology. Also, little evidence exists that PAHs occur in clam tissues. Biomarkers have not been examined in the past, and there no compelling reasons to initiate this work so long after the spill. Given the high cost of the project and the concerns about many of the metrics to be examined, we recommend that the project not be funded

Science Panel Recommendation: Do Not Fund

Science Director Comments:

It has been five years, since any sampling of abundance and distribution of littleneck clams has been conducted. The abundance and distribution information was collected by NOAA for many years and the sampling was stopped in 2000. In 2000, the data appeared to show convergence between oiled and treated and reference sites. However, one data point does not make a trend. Moreover, in 2002 abundance data was collected by a different researcher and although a subset of the NOAA sites were sampled, the project was not inclusive of all the sites. This data demonstrated a continued difference in the abundance of clams in areas that were oiled and treated with hot water washing and reference sites. True consensus on the recovery status of clams is lacking because of differences in data interpretation, differences in study design among projects and because recent information is not available. It would be helpful in understanding the current status of clams if additional information on abundance and distribution were collected from historically sampled areas. Therefore, I recommend that the section of the proposal that sample abundance and distribution of clams be conducted. Additionally, I recommend that the investigators include a broader

range of sites, since there is evidence that differences may occur in sites other than the ones historically sampled by NOAA.

I also recommend that the investigators analyze the clams collected from the abundance and distribution sampling for PAHs. However, I agree the Science Panels recommendations regarding the ancillary tests, such as histopathology and do not recommend that they be funded.

Project Number: 070830
Project Title: Trends in Adult and Juvenile Herring Distribution and Abundance in Prince William Sound, submitted under the BAA
Principal Investigator: Richard Thorne
Affiliation: NGO
Disbursing Agency: NOAA
Project Location: Prince William Sound (PWS)
Project Type: New

Funding Approved by Fiscal Year:

FY07: \$103,400.00	FY08: \$103,400.00	FY09: \$226,800.00
FY10: \$0.00	FY11: \$0.00	FY12: \$0.00

Total Funding Approved: \$433,600.00

Abstract:

Information on abundance, distribution and condition of key herring life stages is needed as a basis for restoration. Critical barometers of the PWS herring population are the adult abundance and condition, as monitored in March, and the juvenile abundance and condition going into and coming out of the long winter period (October to March). Some of this information is currently provided through a program at PWSSC that focuses on herring as a critical food source for Steller sea lions. We propose to fill data gaps in this program with juvenile herring surveys in March of 2007 and 2008 and three additional surveys in FY 2009. These surveys can be conducted in a very cost efficient manner because of the much larger concurrent program that will conduct two surveys each year in FY 2007 and 2008. In addition, the direct capture effort associated with all surveys will be expanded, and biological samples will be available for other uses including disease, marking and stable isotope research. Several collaborations have been established in this regard with investigators at the University of Alaska, Fairbanks, Auke Bay and PWSSC.

Science Panel Comments:

This proposal describes the “backbone” project for many of the other herring proposals submitted to the TC this year. It is a core field project for gaining information about abundance and distribution of herring in PWS, and other management and restoration activities will rely on this data. The project design yields a broader coverage of PWS, and because of matching funds the costs are reasonable. The PI is qualified and has many years of experience. This proposal received strong support from the Science Panel.

Science Panel Recommendation: Fund

Science Director Comments:

Concur with Science Panel. This is a keystone project that will provide status and trend data on herring (juvenile and adult) abundance and distribution throughout PWS across multiple seasons.

Project Number: 070806
Project Title: Are Herring (*Clupea Pallasi*) Energetics in PWS a Limiting Factor in Successful Recruitment of Juveniles and Reproduction Investment of Adults?
Principal Investigator: Johanna Vollenweider
Affiliation: NOAA
Disbursing Agency: NOAA
Project Location: Prince William Sound, Sitka Sound, Lynn Canal
Project Type: New

Funding Approved by Fiscal Year:

FY07: \$139,100.00	FY08: \$0.00	FY09: \$0.00
FY10: \$0.00	FY11: \$0.00	FY12: \$0.00

Total Funding Approved: \$139,100.00

Abstract:

The causes underlying the depressed recruitment rates among Prince William Sound (PWS) herring are unknown, but are likely to include reduced survival of offspring to maturity. Potential agents for depressed recruitment include chronic exposure to pathogens and increased numbers of predators. While identification of the causative agents remains elusive, it is likely that their combined effects are reflected in herring energy dynamics. Previous work in PWS demonstrated the need for juvenile herring to acquire and store energy prior to winter to ensure survival when prey resources were scarce. Juveniles facing increased predation risk or immune response may have less surplus energy available to allocate to storage at the onset winter. In addition, continuing disease and predation stress may increase the rate at which individuals lose energy during winter. Thus decreased offspring survival may result from increased energetic demand over winter. Similarly, adults facing increased energy demand as a result of environmental stress are likely to have decreased energy available for reproduction with consequent effects on offspring survival rates. Therefore, we propose to examine the energy dynamics of herring in PWS and other locations to test the hypothesis that PWS herring stocks have higher energy consumption rates than healthier stocks in other parts of Alaska.

Science Panel Comments:

Whole body energy content is measured in herring from three areas in Alaska, and energy consumption rates are compared among healthy (southeast) and depressed (PWS) populations. The strength of this project is the comparison of the depressed PWS population with other, healthy populations. Understanding how the environments differ between areas with healthy fish and those with a stressed population of herring will enhance our knowledge of factors potentially contributing to the continued decline of herring in PWS.

Science Panel Recommendation: Fund

Science Director Comments:

Concur with Science Panel. Understanding the state of herring in PWS can only be enhanced by comparing similar attributes (e.g., habitat characteristics, body condition, age and size distribution and abundance, etc) between areas with depressed population and areas with healthy populations. This proposal is one of the few that suggests making these comparisons.

Project Number: 070340
Project Title: Long-Term Oceanographic Monitoring of the Alaska Coastal Current
Principal Investigator: Thomas Weingartner
Affiliation: Alaskan University
Disbursing Agency: ADFG
Project Location: Hydrographic Station GAK 1, Entrance to Resurrection Bay,
Project Type: New

Funding Approved by Fiscal Year:

FY07: \$128,200.00	FY08: \$131,300.00	FY09: \$129,500.00
FY10: \$0.00	FY11: \$0.00	FY12: \$0.00

Total Funding Approved: \$389,000.00

Abstract:

This program continues a 36-year time series of temperature and salinity measurements at hydrographic station GAK 1. The data set, which began in 1970, now consists of monthly CTDs and a mooring with 6 temperature/conductivity recorders throughout the water column, a fluorometer and nitrate sensor at 20 m depth and a nitrate sensor at 150 m depth. The project monitors five important Alaska Coastal Current ecosystem parameters and to quantify and understand interannual and longer period variability in:

1. Temperature and salinity throughout the 250 m deep water column,
2. Near surface stratification,
3. Near and subsurface nitrate supply on the inner shelf,
4. Fluorescence as an index of phytoplankton biomass, and
5. Atmosphere-ocean heat fluxes.

In aggregate these variables are basic descriptors of the Alaska Coastal Current, an important habitat and migratory corridor for organisms inhabiting the northern Gulf of Alaska, including Prince William Sound.

Science Panel Comments:

This proposal, which is an extension of an existing TC funded project is well-written and clear in its design. The project measures physical/chemical data from one point in the Alaska Coastal Current that has been measured continuously for over 36 years. The ACC flushes PWS with water, thereby bringing nutrients and food into the system from the Gulf of Alaska. The project would provide basic, environmental measurements of constituents that affect all organisms inhabiting PWS including herring.
